Rome: Guidebooks

During the Middle Ages, Rome was seen as one of the three *peregrinationes maiores*—the most important places of pilgrimage (the other two were Jerusalem and Santiago de Compostela). Pilgrims' guides for Rome often include descriptions of the routes to Rome. The ruins of the antique buildings distinctly reminded those visiting Rome of the fact that this city had been the capital of the ancient Roman empire. Thus three traditions of medieval guidebooks for Rome can be distinguished (although they are often combined within one manuscript): itineraries, descriptions of the antique monuments, and guidebooks for Christian Rome.

Itineraries, transmitted throughout the Middle Ages, served those who had to find their way to Rome from England, Germany, Iceland, or elsewhere. They list the names of places on the road or roads to Rome and the number of miles separating these places; the people who used these itineraries probably asked their way from one place to the next. Although different routes were possible, a few main roads (such as the Via Francigena) can be discerned. Some itineraries also describe sanctuaries that could be visited during the journey to Rome or give other practical information—for example, the condition of the roads, inns that should be avoided or favored, and currencies needed en route.

The earliest examples of descriptions of the ancient city of Rome, which were probably composed in the fourth century and have survived in a small number of manuscripts, divide the city into the fourteen antique districts and list the ancient monuments according to district. The most famous medieval description of the beauty of ancient Rome, *Mirabilia urbis romae*, was very popular from the twelfth century on. It was written in the tradition of the ancient *descriptiones*

urbium and lists the antique buildings (city gates, palaces, temples, etc.) systematically; but it was not originally designed as a guidebook, although it was often misinterpreted as such.

Most medieval *Romipetae* were more interested in Christian buildings than pagan buildings and even showed a certain fear of the ancient monuments, which were often associated with stories about witchcraft and sorcery; thus guidebooks for the catacombs and churches of Rome outnumber books listing the antique buildings. The oldest calendar of Roman martyrs that lists the places where they were buried, and thus can be regarded as a guidebook for the catacombs, dates from the fourth century. Another calendar-like text is the *Stationes ecclesiarum urbis Romae* (*The Stations of the Churches of Rome*); a first manuscript was written in the eighth or ninth century. This work lists the "stational" churches in Rome according to the liturgical year. Pope Gregory the Great (r. 590-604) is believed to have instituted this system: on each feast day, mass was said in a different Roman stational church.

From the thirteenth century on, the main focus of those visiting Rome seems to have shifted from veneration of the tombs of the martyrs to the acquisition of indulgences. Accordingly, from the thirteenth century until the sixteenth, the *Stati on?.* ecclesiarum urbis Romae* was often combined with the immensely popular *Indulgentiae ecclesiarum urbis Romae* (*The Indulgences of the Churches of Rome*), in which the Roman churches with their altars, relics, indulgences, foundation legends, etc., were described. The institution of the first jubilee year (1300) by Pope Boniface VIII—a year during which all pilgrims to Rome could obtain special indulgences—very likely contributed to the enormous spread of this text during the fourteenth, fifteenth, and sixteenth centuries. Most copies of the *Indulgentiae ecclesiarum urbis Romae* first treat the seven principal churches of Rome (those of saints Crux, Johannes Lateranensis, Laurentius et Stephanus, Maria Maior, Paulus, Petrus in Vati-cano, and Sebastianus et Fabianus) and then offer a random selection of smaller churches; however, the copies that arrange the churches according to the topography of Rome were more practical for pilgrims. The relatively large number of (easily transportable) parchment scrolls in which this text is transmitted suggests its practical utility. The differences among descriptions of the churches in the medieval manuscripts still extant are

considerable, not only regarding the number of churches mentioned, but also regarding the wording of the individual descriptions, but information came to be more standardized when printing was developed. The early printed versions combining the *Indulgentiae ecclesiarum urbis Romae* with the *Stationes ecclesiarum urbis Romae* and a history of the Roman emperors were given the misleading modern title *Mirabilia Romae vel potius historia et descriptio urbis Romae*. No English translations of this text were printed during the Middle Ages, but the large number of Latin, German, Italian, French, and Spanish editions shows that it can be regarded as the standard pilgrims' guide in the fifteenth and sixteenth centuries.

The eight Middle English manuscripts of the so-called *Stacyons of Rome* (fourteenth-fifteenth centuries) transmit a version of the *Indulgentiae ecclesiarum urbis Romae* in verse (the only verse adaptation of the text), and two further manuscripts transmit a description of the Roman churches in prose. Again, the title of the text is misleading, as both versions contain the *Indulgentiae ecclesiarum urbis Romae*, not the calendar-like *Stationes ecclesi-arum urbis Romae*.

Guidebooks to Rome could also serve the purpose of a "pilgrimage in the spirit": a meditative journey that allowed the "pilgrim" to visit the churches of Rome without having to leave home. This form of devotional exercise, which became popular in the fifteenth century mainly among nobles, may have developed because of widespread criticism of real pilgrimages. Some of the manuscripts for "pilgrimages in the spirit" were lavishly illustrated with miniatures of the Roman churches; however, they depicted not church buildings that could actually be seen in Rome but rather general, stylized churches.

Additional information on the monuments that pilgrims visited and on their experiences in Rome can be gained from pilgrims' reports, especially from the early and High Middle Ages, when guidebooks were still relatively rare; examples include the texts written by Sigeric of Canterbury, who visited Rome in 990, and Nikolas of Munkathvera (c. 1150). Pilgrims in the late medieval period such as John Capgrave (c. 1450), William Brewyn (c. 1470-1477), and Arnold von Harff (c. 1496-1499) tended to copy the *Indulgentiae ecclesiarum urbis Romae*, merely adding a few personal remarks.

Romuald of Ravenna, Saint

Saint Romuald of Ravenna (c. 952-1027) was a monastic reformer and the founder of the Camaldolese order and is considered one of the founders of the Italian eremitical movement of the eleventh century.

Romuald was born into the ducal Onesti family at Ravenna. When he was twenty, his father killed a kinsman in a duel, and Romuald entered the Benedictine monastery of Sant'Apollinare in Classe to perform a forty-day penance for this act. The monastery had a profound effect on him. At the end of the penance he decided to stay, took monastic vows, and entered enthusiastically into a rigorous observance of the Benedictine rule. However, reading the lives of the desert fathers led Romuald to criticize what he considered laxity at Sant'Apollinare, and he soon left the monastery to live as an anchorite in the marshes surrounding Ravenna. About 975, Romuald became the disciple of the hermit Marino and followed him to the vicinity of Venice.

Through Marino, Romuald was drawn into the circle of Venice's doge, Pietro Orseolo, who was then undergoing a religious conversion. When Orseolo abdicated to join the monastery at Cuxa in the Pyrenees, Romuald and Marino went with him. Romuald remained at Cuxa for ten years, studying the works in its library in order to refine his understanding of the monastic ideal. Although the final shape of his reform was the product of many years of experimentation, the basic notions seem to have been formulated at Cuxa. Romuald's foundations would be among the first expressions of an eleventh-century monastic reform movement that sought to revive the primitive rigor of early Egyptian eremitism.

Romuald returned to Italy on the death of Orseolo in 988. He spent the next ten years based in Pereum, a hermitage in Ravenna's marshes, while he wandered the Apennines seeking followers, founding monasteries, and experimenting with monastic organization. Like a number of other reformers of his time, Romuald was determined to develop a greater spirit of contemplation in monastic houses; accordingly, he established hermitages and cenobitic communities together. But unlike other reformers, Romuald did not believe that a cenobitic life was a necessary prerequisite for an eremitic life. At his foundations, promising candidates were immediately introduced to the life of the hermit. Moreover, he did not subordinate the hermitage to the abbot of the monastery but rather put the cenobites under the moral authority of an experienced hermit. The monastery and hermitage were supposed to complement each other in drawing all monks toward the eremitical ideal of fasting, silence, and solitude.

In 998 Emperor Otto III appointed Romuald abbot of Sant'-Apollinare in Classe, but the monks' resistance to his austerity led to his resignation within a year. He then moved to the environs of Rome, near the imperial court, and soon attracted the patronage of several of the emperor's courtiers. When civil unrest at Rome drove the court to Ravenna in 1001, Romuald followed, again settling in Pereum. Romuald now had significant support from the empire. Followers flocked to him. Many, including the imperial chaplain Bruno of Querfurt, went as missionaries to convert the Slavs, inspired by Romuald's insistence that preaching and conversion were the ultimate role of the monk and hermit.

After the death of Otto III in 1002, Romuald left Pereum to wander again in the Apennines. Sometime between 1010 and 1020, he founded a small monastery and hermitage at Camaldoli near Arezzo. This influential institution, famous for its rigor, proved to be his most lasting contribution to eremitical reform. Romuald died at Val di Castro in 1027. By then, his other foundations were already looking to Camaldoli for leadership, and other monastic reformers were drawing inspiration from it.

Romuald had not intended to establish an order separate from the Benedictines. However, after his death the thirty-odd monasteries he had founded drew together around Camaldoli, in part to protect the

peculiar customs Romuald had established for them. By the late eleventh century, the Gregorian popes were treating them as an order. The most famous Camaldolese monk, Peter Damian, drew many of his reforming ideals from Romuald. Peter wrote a very influential biography of Romuald in 1042.

Romulus Augustulus

Romulus Augustulus (r. October 475-September 476) is generally considered the last western Roman emperor, although he ruled as a figurehead and his power was never formally recognized in the east. His father, Orestes, overthrew Emperor Julius Nepos and placed Romulus Augustulus on the throne. Subsequently, Orestes's troops, led by Flavius Odoavcar (Odoacer), rebelled against Orestes and Romulus. Orestes was executed in August 476 at Piacenza (Placentia). Odovacar forced Romulus Augustulus to abdicate, gave him an annual allowance of 6,000 gold pieces, and sent him to live at Misenum in Campania.

Rothari

Rothari (d. 652, r. 636-652) was duke of Brescia before becoming king of the Lombards. His selection as king was legitimized by his marriage with Gundeberga, who was a sister of one former -dng (Adaloald) and the widow of another (Arioald). Rothari is sne of the few Lombard

kings who is known with certainty to have been Arian Christian rather than Catholic. Like Alboin, Rothari became a hero—Rother—in medieval epics.

Rothari is best-known for the law book issued from his court and known as *Rothari's Edict*. This is a compilation of customary Lombard law, a law that applied only to Lombards. Non-Lombards in the Lombard kingdom continued to use their own law, whether Gothic or Roman, as is apparent from the content of the Lombard laws and from the survival of eighth- and ninth-century charters and court records in which individuals identify themselves as living by Lombard, Gothic, or Roman law.

Rothari is usually identified with the pro-Lombard faction in the Lombard kingdom, and his *Edict* is mainly a codification of Germanic custom—one of the best-organized of the barbarian law codes. However, the *Edict* does reflect considerable Roman influence. Royal legislation is itself a Roman act, the language of the *Edict* is Latin, and the clear-cut organization of the code into separate categories is almost certainly based on the Roman model. Although we do not know the legal personnel who served Rothari, they were almost certainly Roman or trained by Romans.

Rothari was succeeded by a son who was killed after a very-brief reign.

Rudolf II of Burgandy

Rudolf II (d. 937, r. 911 or 912-937) was a duke and king of Burgundy and a king (922-926) of Italy. Burgundy was one of several petty kingdoms emerging in the turbulent years after 887 as Charlemagne's empire broke up. It roughly corresponded with what later became the Franche-Comté, or "free county," of Burgundy. In December 921 or January 922, disgruntled nobles led by Adalbert of Ivrea called on Rudolf to overthrow Berengar of Friuli, who had been the Lombard king and emperor since 915 (however, the western emperorship by now meant little). Berengar was defeated by Rudolf in 922 and 923 and was murdered in 924. The Lombard nobles, as treacherous as ever, invited Hugh of Arles into Italy in 926. Hugh drove Rudolf back to Burgundy but evidently surrendered Provence in return for Rudolf's promise never again to invade Italy.

Rufinus of Assisi

Rufinus (d. before 1192) was born outside Assisi in the first quarter of the twelfth century. He studied theology and canon law at Bologna under Gratian and first appears as a master there c. 1150. His known students included Stephen of Tournai and John of Faenza.

Rufinus's most important contribution was his commentary on canon law, *Summa decretorum*, published between 1157 and 1159. This was the first full-length commentary on Gratian's *Decretum* and was highly influential through the early thirteenth century (the third part of John of Faenza's *Summa* merely copies Rufinus). The work was also original in applying the current exegetical methods of the civil lawyers and the most recent scholarship (including Peter Lombard's *Sentences*, 1155-1158).

Rufinus was consecrated bishop of Assisi sometime before 1179. At this time he wrote *De bono pacis*, an exposition of Augustine's *De civitate dei*. In 1179, Rufinus delivered a sermon at the opening of Lateran III. In this sermon, as in his *Summa*, he urged ecclesiastical reform according to canon law. Ecclesiastical jurisdiction, as Rufinus understood it, was divided between the *auctoritas* of the pope and the *administratio* of the emperor. This strong assertion of papal supremacy would greatly influence later decretists. Between 1180 and 1186, Rufinus was elevated to the archbishopric of Sorrento.

Ruggeri Apugliese

Ruggeri Apugliese (thirteenth century) was from Siena, and it is generally assumed that he was a *giullare* (a jongleur or minstrel), though of a relatively high social rank. There is little reason to follow Torraca (1902) in doubting his existence. Ruggeri is recorded in the Vatican Codex (Lat. 3793) as the author of a poem known as the *Canzone de oppositis: Umile sono ed orgoglioso*. His play on oppositions is directly inspired by Raimbaut de Vaqueiras's poem *Savis e folles, humils et orgulbos*. Ruggeri's *can-zoniere* is limited in scope but quite diversified, comprising, in addition to the *Canzone de oppositis*, a sermon, *L'amore di questo mondo è da fugire*; a parody of Christ's passion, *Genti, intendete questo sermone*; and a political *tenzone* exchanged with Provenzan Salvani.

Ruggero D'Amici

Ruggero d'Amici (thirteenth century) was from Messina and owned feudal lands in Calabria. As one of the highest dignitaries at Frederick's court, he was *giustiziere* of Sicily in 1239 and 1240 and then *capitano* of Sicily and Calabria until the end of 1241, at which time he was sent as ambassador to Sultan Malek-Saleh in Egypt, where he remained until the following year. Ruggero was accused of participation in a conspiracy against the emperor and was imprisoned in 1246. It is not clear whether he died in prison or was executed. Two *canzoni*—*Sovente Amore n'ha ric- cuto manti* and *Lo meo core che si stava*—are attributed to Ruggero in the Vatican Codex (Lat. 3793), and a few others are of dubious attribution.

Ruggerone Da Palermo

Ruggerone da Palermo (thirteenth century) remains virtually unknown. Some scholars have identified him with a *frate* Ruggero who was sent to the king of Tunisia by Frederick II to obtain the *Book of Sidrac*. Scandone (1904) identifies him with a judge from Palermo, Ruggero de Panormo. Only one poem— the *canzone Ben mi deggio alegrare*—is

unquestionably his; the crusade poem *Oi lasso non pensai*, though attributed to him in the Vatican Codex (Lat. 3793), was more probably written by Frederick, as asserted in the Florentine manuscript (Laurenziano Rediano 9). In *Ben mi deggio alegrare*, the poet sings of the joy that love has finally brought him after a long period of torment. The poem ends on a moralizing note, urging lovers to endure suffering in order to reap the reward that is waiting at the end: *dolci è lo male ond'omo aspetta bene!*

Rustico Filippi

The Florentine poet Rustico Filippi (Rustico di Filippo, c. 1230-c. 1280 or 1285) is credited with initiating the comic style in the medieval Italian lyric. Rustico wrote fifty-seven sonnets transmitted by the Vaticano manuscript Latino 3793, and a *tenzone* with Bondie Dietaiuti found in three other codices. Half of his sonnets were written in the serious style of courtly love; the other half provide one of the earliest examples of the comic, or jocular, style in Italian literature. Brunetto Latini, who considered Rustico one of his closest friends and an accomplished poet,

dedicated the *Favolello* to him. Rustico was also the acknowledged teacher of Jacopo da Lèona and is the protagonist of a comic sonnet by Jacopo. Rustico was an ardent Ghibelline.

Rustico's comic sonnets fall into two categories: personal invective, and caricature directed against Florentines of all ages and social conditions. Among the figures he caricatured are warriors who inspire laughter rather than awe, a miser, a cuckolded husband, a man who is the paradigm of laziness, people with offensive body odors, libertines on the prowl, and prostitutes. Rustico displays a great talent for euphemism and uses a plethora of creative metaphors, similes, paraphrases, and hyperbole to describe his characters, the sexual act, and certain parts of the human anatomy. Several of the comic sonnets are linked. For example, there is a three-sonnet group that begins with *Poi che guerito son de le mascelle*, recounting the implausible proposals made by a matchmaker to a poor father with two daughters; and there is a two-sonnet group beginning with *Su, donna Gemma, co la farinata*, which ponders the suspicious reasons behind the sudden loss of weight of a young girl named Mita. The best-known of Rustico's comic sonnets, *Quando Dio messer Messerin fece*, describes Albizzo de' Caponsacchi as a unique combination of bird, beast, and man—a miracle of God's creation.

In the sonnet describing "*messer Messerin*," and in other sonnets, Rustico frequently compares the targets of his caricatures to animals, at a time when such comparisons were in vogue in the serious courtly love lyric. Whereas in his comic poetry Rustico mocked the overuse of animal comparisons, he avoided them altogether in his twenty-eight sonnets and the *tenzone* in the traditional courtly style. In these compositions, he experimented with various rhetorical devices in order to achieve more drama and more narrative flexibility. Among his innovations, he broke the unity of address, extended personification from the conventional god of love to other items involved in the *psychomachia* of courtly love (the heart, the eyes), and abandoned the extended simile. One sonnet that illustrates all these elements is *Amor fa nel mio cor fermo soggiorno*. The integration of dramatic techniques into the lyric, and the cultivation of a kinetic rather than a descriptive style, reached a culmination in the poetry of the *dolce stil nuovo*. Thus Rustico was an innovator in introducing comic poetry to Italian

literature and, to a lesser extent, in the development of the love lyric.

S

Sacchetti, Franco

Franco Sacchetti (c. 1330-1400) was born to a noble Florentine Guelf family, perhaps in Ragusa, where his father did business. Sacchetti spent many years as a merchant. By 1352, he was also composing traditional love poems. In 1354, he married Felice di Nicolòzi. In honor of the Strozzi women, he composed, probably shortly before his marriage, *The Battle of Women*, consisting of 272 mediocre octaves describing the victory of young, beautiful, virtuous ladies over old, ugly, vice-ridden hags. In the early 1360s, during the war between Florence and Pisa, Sacchetti began to be involved in the city's politics and as an administrator of Florentine territories. In 1376 he was sent as ambassador to Bologna; in 1383, when he married for the second time, he was a member of the *otto di balia*; in 1384 he became a prior for the San Giovanni area; during the wars with the Visconti in 1388–1392, he served as counselor to the Florentine government; and throughout the late 1380s and the 1390s he was governor over a series of Florentine territories outside the city.

The 1370s brought a series of sorrows, both personal and public. Sacchetti was in Florence during the plague of 1374. That year and the next saw the deaths of Petrarch and Boccaccio, whom he lamented in sonnets expressing his admiration and sense of loss. Two years later, his first wife died, mourned affectionately in his verse. Meanwhile Florence was threatened by the expansionism of the Milanese and by papal agents who sought to restrict Florentine trade routes across papal territories. To fend off the latter, Sacchetti became involved in the "war of the eight saints" (1375), but hard times and high wartime taxes contributed to the revolt of the *ciompi* (1378). Some of Sacchetti's poems express his views on current political events. "The world is full of false prophets," begins one; another starts, "Wherever virtue is lacking, there all worldly power must soon fail and come to a painful end"; and one

ends, "Tell the pope, where he is awaited, that all the limbs fare ill when the head is obstinate in evil."

At the same time, Sacchetti was composing song lyrics, combining a popular immediacy of content with a technical interest in various forms for music. One *caccia* describes how girls, gathering flowers and mushrooms in the woods, are scattered by a thunderstorm while the poet, watching them entranced, gets soaked by the rain. "Blessed be the summertime," begins another song. In 1389, during a moment when tension had relaxed, he took part in the garden conversations and entertainments described in *Il paradiso degli Alberti*. He married for a third time in 1396.

During his later years, Sacchetti began to write in prose. His unfinished *Commentary on the New Testament*, perhaps written in 1381, seeks to apply the evangelists' words to problems and issues of daily life. The use of contemporary moral examples in his biblical commentary led to his writing the *Trecentonovelle* (*Three Hundred Stories*, 1385-1397), accounts of recent events or jokes, unframed but surrounded by personal and moral reflections. The work includes serious issues, despite the frequent stories about pranks and witticisms. Although Sacchetti refers to himself in the preface as "unschooled," his life experiences had made him sensitive to the importance of peace and to the prevalence of injustice. A number of *novelle* comment on how degenerate nobles live by plunder taken from the less fortunate and get away with crimes while the poor, persecuted for minor offenses, have no recourse against the rich and powerful. On the other hand, Sacchetti opposed the presumption of ignorant folk, and several tales present Giotto or Dante wittily putting down ambitious fools. With a clear eye for details of food, dress, and behavior, and with a conversational style, Sacchetti delightfully captured aspects of contemporary life: the difficulty of enforcing dress codes, a chase after a runaway pig, a quarrel between husband and wife, the embarrassment of a youth who trips and falls while eyeing girls, a wet soldier's refuge from his own bare hovel in the warm and well-stocked kitchen of a neighboring ecclesiast. This period also saw the composition of some moral and political *canzoni*, with pleas for peace and moderation. Sacchetti himself collected his poetry over the years into one volume, of which the autograph is preserved in the Laurentian Library in Florence. He

compiled his collection of tales in the 1380s and 1390s. Of the 300 stories, 223 survive, a few with gaps or in fragments. Besides these writings, we have sixteen of his letters and a notebook, never intended for publication.

Sacchetti died at San Miniato, where he was governor. His tales went unappreciated by the humanists of the following century, but two sixteenth-century manuscripts survived. The first printed edition of a selection of tales appeared in 1724.

Sacchetti, Giannozzo

The Florentine poet Giannozzo Sacchetti (c. 1340-15 October 1379) was a member of an aristocratic Guelf family. He was the younger brother of Franco Sacchetti, who was a renowned poet, the author of *Trecentonovelle*, and a successful merchant and political figure. Unlike his prudent older brother, Giannozzo led a dissolute life, and he argued constantly with his brothers and sisters about his share of the family's inheritance. However, he was a skilled jewel cutter, and he also served as Florentine ambassador. In the capacity of ambassador he traveled in 1369 to Milan (where he met Bernabò Visconti, duke of Milan), and in 1377 to Chiusi and Siena (where he became a follower of Saint Catherine of Siena, whom he had met in Florence in 1374). As his financial situation deteriorated, Giannozzo was besieged by creditors; in April 1379 he was sent to the Stinche, the debtors' prison. He was released a month later and fled to the camp of Charles of Durazzo, near Treviso. Giannozzo plotted with Florentine exiles to overthrow the republic and was arrested soon after his return to Florence. Having been found guilty of treason, he was executed on 15 October 1379.

His small poetic production of only nine poems—five *can-zoni*, two sonnets, and two *laude*—perhaps indicates that, unlike his more famous brother, Giannozzo did not consider himself a literary figure. Yet several of the poems demonstrate Giannozzo's artistry. For example, in the melancholic *canzone* *Chi non è meco a rinovare il pianto*, the poet represents the conflict between body and soul, discoursing with his deceased lover and contrasting the memory of her physical beauty to her present state of decay. In this poem, Giannozzo reminds us of Guido Cavalcanti. However, Giannozzo never reaches the level of philosophical abstraction of the *stilnovista*; rather, he distorts elements of the *stilnovo* in order to vent his sense of desperation, (*The schietti piè leggieri e bianchi become consumati e stanchi* spartite l'ossa e le midolla spentel che fanno gran paura a chi gli vede, 15-17).

Thematic variety and originality of expression can also be seen in the sonnets *Mettete dentro gli spezzati remi* and *Ristretto tra levante e 'l mar remoto*. The first sonnet expresses the poet's admission of failure in this life and the awareness that only death can lead him to a better one: *ch'i' vo' tornare al creator divino/ con nova barca e con novo timone,/ lasciando a voi la trista vita mia* (12-14). In the second sonnet, Giannozzo gives voice to the classical theme of humankind's passivity and lack of self-determination; yet by refashioning the myth of the Fates, he breathes new life into an old theme. Cloto is a shipbuilder; Lachesis guides the vessels at sea and, like Eolus, *A l'ultimo Antropòs ciascuna sprona/ove forza non val, prego né grida/che non l'affondi e rompa a grande stento* (12-14). The idiosyncratic depiction of the Fates is perhaps intended as a critique of bourgeois optimism. Whatever Giannozzo's intentions, the emotional intensity of the final lines underscores the poet's pessimistic outlook on life.

Unfortunately, two sonnets and a handful of poems cannot provide us with a detailed portrait of this complex figure. We know for certain only that Sacchetti was a troubled man whose poems reveal a tragic sensibility, similar to that of other *poètes maudits*.

Sacraments

From its earliest existence the Christian church has considered certain rituals and ceremonies particularly sacred and significant, and vehicles of divine grace. These were called sacraments.

In the beginning, two rituals were recognized as sacraments: baptism, a ritual of initiation and cleansing with water, usually through immersion; and the eucharist, a sacred meal of bread and wine, recalling Christ's last meal with his disciples. These underwent much expansion and theological definition in the late antique and early medieval periods. Baptism became an elaborate rite of passage with elements of renunciation of the past, cleansing from sin, and transformation through ritual identification (in the immersion in water) with Christ's death and resurrection. Sites for baptism (pools for immersion) might be located within the church building or in a separate structure (usually centralized in plan, circular, square, or octagonal).

Most medieval churches in Europe incorporated within the nave of the church a font for baptizing infants. Italy remained different, however, for it generally kept the tradition of a separate building: Florence, Cremona, Pisa, and Parma erected significant examples of separate baptisteries during the twelfth century; and earlier examples were to be found in Nocera, Ravenna, and Lo mello.

The eucharist consisted of a service of the word" (scripture readings, hymns, prayers, and a sermon) and the sacred meal: prayers; the offertory (bringing the wine and bread to be consecrated); the words of institution and consecration repeating Christ's words at the Last Supper, "This is my body . . and "This is my blood ..."; communion; postcommunion prayers; and almsgiving. This ritual came to be known as the mass and became a sacred drama which realized a divine presence, increasingly focused on the bread and wine, and related to Christ's sacrificial death.

During the eleventh through thirteenth centuries, the formal theological definitions of the sacraments and their qualities were clearly articulated, and the number of sacraments was designated as seven. Much of this was accomplished by Hugh of Saint-Victor, in *De sacramentis christinae fidei*; and by Peter Lombard, in *Sententiae*. The classic scholastic expression was offered in Thomas Aquinas's *Summa theologiae*. In the twelfth century, Gratian's *Concordantia discordantium canonum* (*Decretum Gra-tiani*), written in Bologna and used by Peter Lombard, gathered numerous patristic texts concerning the sacraments and sought a coherent interpretation, with emphasis on behavior and on the juridical aspect.

What would become the third of the seven sacraments was a ceremony of anointing with oil, originally associated with baptism. In the western church, this became an independent ritual known as confirmation and was reserved for celebration by the bishop. When infant baptism, rather than adult baptism on conversion, became the norm, people usually received confirmation as young adults.

A fourth sacrament was extreme unction. This was derived from the ritual anointing of the sick for purposes of exorcism in the early church. It became a rite of passage for the dying and could be associated with a final ministration of communion.

Saint Thomas Aquinas, *Summa theologiae*. Duaci: Sumptibus Marci Wyon, Typographi Iurati, 1614. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

The fifth sacrament was penance, or confession. In the early church, this was a sacramental act of public confession of sin and public penance, assigned by priests or bishops and including excommunication and gradual readmission to the community of worshipers. In the early Middle Ages, under the influence of Irish missionaries and the penitential handbooks they brought to the continent, the practice of

private confession by individuals to priests emerged, with the consequent private assignment of penance and priestly absolution. This sacrament became increasingly important in the lives of individual Christians and the overall "economy" of salvation, since confession, penance, and absolution removed the guilt and consequent punishment resulting from sins. Penance was concerned with sin, punishment, and the continuation of that punishment after death for those who were not immediately admitted to heaven (i.e., all who were not saints). This concern can be seen in the elaboration of the doctrine of Purgatory (and hell) in the twelfth century, building on concepts of the afterlife that had been present from the earliest Christian centuries. Indulgences (forgiveness of punishment for sins) also played an important role in the spiritual dynamics of the sacrament of penance, and the fate of Christians after death. A development of fundamental import for medieval sacramental practice occurred at the Fourth Lateran Council in Rome in 1215. The council required yearly communion by each adult; furthermore, individuals were also required to confess their sins to a priest and to receive penance and absolution before communing (usually at Easter). This inaugurated a vast literature of pastoral care (*summae confessorum*, in particular) to give the priests resources for properly carrying out the task of hearing private confessions. Moreover, confession, which had been voluntary for laypeople, now became a yearly religious obligation. Ideas of penitential acts, especially asceticism and self-flagellation, influenced at least two striking developments in lay piety. One development was the roaming bands of flagellants that appeared in Italy c. 1260 and spread throughout Europe. A second development was the urban phenomenon of confraternities of penitential flagellation (*battuti* and *disciplinati*), which assumed central roles in cities such as Florence and Venice in the late Middle Ages.

The sixth and seventh sacraments were priestly ordination and marriage. Each of these was reserved for a single cohort in the medieval population, because in the eleventh and twelfth centuries the priesthood came to presuppose celibacy. It was during these centuries that the church began to insist on marriage as a sacrament and, accordingly, to assume that the church should administer marriage law, deciding what constituted valid and invalid marriages. Ivo (bishop of Chartres), Hugh of Saint-Victor, Peter Lombard, and Gratian were especially important

in defining the sacramental nature of marriage, its theological significance, and the practical issues to be negotiated in regulating marriage through church law.

Between the ninth century and the thirteenth century, the eucharist (or mass) received special attention from theologians intent on examining the nature of the divine presence. In the Carolingian period, the Paschasius Radbertus and Ratramnus, abbot and monk of Corbie, respectively, engaged in a dispute about the presence of the divine in the elements of the eucharists. Radbertus argued that the bread and wine appeared to be bread and wine but in truth were Christ's body and blood—body and blood from Christ's mother Mary, crucified, resurrected, ascended, and now miraculously present to the believer in the mass. Ratramnus replied that the bread and wine remained bread and wine in truth; symbolically, they represented to the believer the spiritual presence of the body and blood. Radbertus's position, which reflected the piety already present in texts and in the devotion of the people, became the received opinion in his day and afterward. The condemnation in 1050 of the views of Berengar of Tours with regard to the eucharistic presence showed the strength of support for a theology of "real presence" in the eucharist.

In the twelfth century, Hugh of Saint-Victor, Gratian, and Peter Lombard worked out precise definitions of the sacraments, carefully delineating the relation of the "material" of the sacrament (such as water for baptism), the sacred action, the word spoken, and the spiritual presence. The list of seven sacraments was recognized, along with numerous sacred rituals that came to be known as sacramentals. With the theological synthesis of Thomas Aquinas, and the application of the Aristotelian distinction between substance and accidents, the nature of divine presence ("real presence") in the eucharist was formulated with greater precision. The accidents of bread and wine (taste, color, etc.) remain in the consecrated elements of bread and wine; however, the substance of the bread and wine is miraculously transformed into the body and blood of Christ. This doctrine is known as "transubstantiation"—a word given official sanction through its use by the Fourth Lateran Council in 1215, before Aquinas's more precise theological explication. Transubstantiation became the received eucharistic theology of the later Middle Ages. Any number of

miraculous occurrences in which the host (the wafer of unleavened bread used in the liturgy) bled or was transformed in visionary experiences into Christ's bodily appearance served to underscore for the pious the reality of the divine presence in the consecrated sacred bread. The feast of Corpus Christi, dedicated to the veneration and exhibition in processions of the consecrated host (the bodily presence of Christ), was established through the efforts of Julianna of Mont-Cornillon (d. 1258) after visionary experiences. Pope Urban IV promulgated its observance in the bull *Transiturus* (1264), and Thomas Aquinas composed its liturgy (including the hymn *Pange lingua glo riosa*).

Saint Cecilia Master

The current name "Saint Cecilia Master" was inspired by a large panel painting (now in the Uffizi in Florence) that was created as an altarpiece for the titular saint of one of the earliest Florentine churches. The painting represents Saint Cecilia enthroned, flanked by eight scenes from her legend. The narratives are populated by attenuated figures whose tiny heads perch on unusually long necks. The idiosyncratic style of the artist is marked by a taste for richly embellished surface patterns: intricately detailed fabrics, marble revetments, and intarsia decorate elaborate architectural environments that he frames with meticulously tooled gold leaf. The compositions also reveal a profound interest in spatial concerns. Wedged between the orthogonals of splayed walls, barrel vaults and ceiling panels shape the perception of recessional space that is defined further by raked floors, balconies, and the darkened planes of antechambers. The diminutive scale of the figures enhances the illusion that they occupy interiors of measurable depth. The altarpiece serves primarily to gauge the formal preoccupations of its maker and in fact is rarely studied for its intrinsic value. Instead, its resemblance to frescoes in the upper church of San Francesco in Assisi first attracted the attention of connoisseurs, who began to assemble a body of related works that they attributed to the Saint Cecilia Master. The relationship between the Florentine altarpiece and the Franciscan murals continues to dominate art-historical literature, in which the former assumes a secondary role.

Master of Saint Cecilia (fourteenth century), *Saint Cecilia and Stories from Her Life*. Uffizi, Florence. Photo: © Scala/Art Resource, N.Y.

Of central concern is the contribution of the Saint Cecilia Master to *The Legend of Saint Francis*, a narrative cycle that begins at the crossing on the north wall of the upper church and encircles the entire length of the nave. This cycle was traditionally attributed to Giotto and was considered a youthful work; Giotto was supposed to have reworked many of its motifs and compositions in Padua and later in Florence. A number of contemporary scholars still adhere to this tradition; they are reluctant to remove a commission of this magnitude from the career of the most celebrated artist of the early *Trecento*—and the successor to Cimabue, who had just completed work in the choir and the vaults of the upper church. Yet by 1875, when Crowe and Cavalcaselle published the Italian edition of their history of Italian painting, distinctly different styles were being recognized in the cycle, and certain scenes were associated with the panel from Santa Cecilia in Florence. Eventually, the major portion of the fresco program was assigned to the Saint Francis Master or to a follower, who worked during the final decade of the thirteenth century. Offner and Steinweg (1986) provide a comprehensive inventory of the literature and a bibliography, amplified by Boskovits. The catalog reflects the consensus of many art historians, who assign the first and final three of the twenty-eight compositions to the painter of the Saint Cecilia altarpiece.

Among those who accept this attribution, debate centers on the relationship of the scenes by the Saint Cecilia Master to the remainder

of the fresco program. The relatively limited number of compositions and their location at the western end of an "occidented" nave suggest that they were added sometime after the completion of the intervening scenes. Most difficult to resolve is the idea that the *Recognition of the Saint*, the scene that inaugurates the cycle, was postponed, especially since it is part of the gradual conversion of the saint that unfolds in a series of six interrelated compositions filling the first two bays of the nave. Many scholars assume that the Saint Cecilia Master simply conformed to a design established by his predecessor, but Smart (1960) claims that this master was the innovative force behind the design of the entire program and commanded a more refined style that was carried on by a lesser talent, the Saint Francis Master. Smart argues that the inventive compositions indicate the influence of Giotto—not that Giotto introduced ideas here which he advanced at later sites. This argument compels Smart to date the cycle to the beginning of the fourteenth century, when the unknown master would have been able to respond to Giotto's ongoing work in the Arena Chapel. Parrochini (1994) proposes a similar scenario, describing the Saint Cecilia Master as a disciple of Giotto but also identifying him as Pietro Cavallini, a Roman muralist whose frescoes in the convent of Santa Cecilia in Trastevere survive only in fragmentary form. Other scholars suggest Buffalmacco, whom Boccaccio, Sacchetti, and Vasari placed in the tradition of Florentine art.

One of the most striking aspects of the work of the Saint Cecilia Master in San Francesco is the role of architecture in the compositions. The first scene takes place on the streets of Assisi. Here, the artist connects the world of pictorial representation and the world of the viewer by depicting local buildings, including the Palazzo del Capitano del Popolo and the temple of Minerva. These references are not exact imitations, however. For example, the pediment of the ancient temple has been transformed into the tympanum of a medieval church, foreshadowing the spiritual transformation of the youthful saint, who is still unaware of his fate. It also serves as a compositional bridge, connecting Saint Francis to the man who recognizes his holiness. Across the nave, in the final scene, the spiraling relief above a prison evokes Trajan's Column. The appearance of ancient monuments in these works is often interpreted as a type of classicism, the triumphal

column suggesting that the artist had journeyed to Rome. However, the white bands that wind around the terra-cotta column in the final scene are also a fanciful variation on Roman imperial prototypes; the colors are reminiscent of the marble and brick used for the Byzantine column that once stood before Hagia Sophia.

The Saint Cecilia Master seems to have worked primarily on a smaller scale, judging from a very small group of panel paintings made for churches in Florence and the nearby town of Montici at the beginning of the fourteenth century. An inscribed image of Saint Peter dates to 1307 and is associated with one of two panels that Giuseppe Richa saw in the important Benedictine convent of San Pier Maggiore. This gabled dossal is joined by two others from Santa Margherita at Montici: an enthroned Madonna, and a wider panel that represents the titular saint flanked by six scenes from her legend. The latter joins the work of the Saint Cecilia Master as an example of a *vita* panel, a type of hagiographic image that surrounds the cultic central effigy with narratives from the life and miracles of the saint. Although *vita* panels are associated primarily with the Franciscans, they played a long role in Florence during the thirteenth and fourteenth centuries. In describing the altarpiece of Saint Cecilia, Giuseppe Richa (1775) was fascinated by the relationship between the cult image—which he described as "a relic of art"—and relics of the legendary martyr. The narratives on the panel present Saint Cecilia as she appears in late medieval preachers' manuals: an exemplar of wifely virtue whose piety inspired the conversion of her husband, family, and community. The shape of the work suggests that it was used as an altar frontal, erected before the altar to face the men and women of the parish it once served.

Saints' Lives: Italian Hagiography in the Vernacular

Hagiographic literature in Italian is abundantly represented in prose and poetic texts in the Middle Ages and continuing through the Renaissance; indeed, folklorists have collected poems relating events connected with saints and recited in various parts of Italy until the present day. This should come as no surprise, given that the genre is well represented in other traditions (e.g., in French, German, and English), yet these texts have often been overlooked—so often, in fact, as to give the mistaken impression that very few texts from the medieval period exist. The reason is not difficult to understand: hagiographic texts in verse and prose were written alongside other works—most notably by Dante, Petrarch, and Boccaccio—that had a profound impact on Italian literature in particular and European

literature in general. The generally modest hagiographies pale in comparison with these.

In more recent times, when their religious relevance was minimized, hagiographic texts were seen as representative of backward thinking. They were collected principally as modest examples of *Trecento* style, and when they were studied, the focus was often on language instead of content. When they were examined as folklore, they were considered difficult to compare with Italian literary masterpieces and difficult to appreciate in the context of such masterpieces. Moreover, the nature of textual production and transmission of hagiographic works had made knowledge of them difficult to attain.

The earliest hagiographic works in verse or prose were largely to be found in isolated manuscripts. Since many of these individual works did not attract the interest of literary scholars, the effort of transmitting them by modern editions was not viewed as particularly rewarding. Of course, prose collections (e.g., those of Jacobus da Voragine and Domenico Cavalca) were read and appreciated, and they represent a valuable and worthy dimension of hagiographic literature that had significant resonances; for one thing, they were used as the subject of *exempla*, and as illustrative material for sermons. But isolated lives did not fare so well.

Furthermore, in European literature there is the problem of assigning chronological boundaries to the Middle Ages and the Renaissance. In Italy, the Renaissance is seen as beginning in the fourteenth century; but in France, for example, it seems to appear in the early sixteenth century, and the end of the medieval period is often arbitrarily assigned the date of 1500. Such demarcations are problematical for hagiography. It is by no means true that hagiographic works were occasionally written down in the fourteenth and fifteenth centuries and then promptly vanished from the scene; on the contrary, the spirit animating these texts continued to live on into the sixteenth century and beyond. Thus to fix a date of, say, 1500, runs the risk of misrepresenting the extent and richness of the genre: texts which may have been written before 1500 and reprinted many years thereafter, and for which we no longer have manuscripts earlier than 1500, would automatically be eliminated from consideration. In the opinion of the present writer, such later versions should be taken into account if they appear to be

connected to earlier times. Why exclude a printed text from the early 1500s that says *ristampata* ("reprinted"), if the original is lost?

In considering why hagiographic literature in the vernacular has not been more extensively studied, although hagiography in Italy was certainly of general interest, one more point may be made. In many cases, when studies on Italian hagiography were announced, attention was given mainly to texts in the Latin language; as a result, the vernacular dimension was difficult to isolate

In our context, verse and prose texts were, to a great extent, directed to different audiences, and this has also been the case in other traditions. Useful bibliographical aids that are not too difficult to find treat one genre or the other. In Italian, poetic texts have chiefly been identified and cataloged; only recently have prose texts received this treatment.

Hagiographic works need not be grouped only in terms of whether they are in verse or prose. A different grouping, made by students of vernacular hagiography, involves considering separately works existing in manuscripts and those transmitted in printed texts. Manuscripts are seen as representing the medieval period; printed texts are seen as part and parcel of the new age and for this reason are more easily excluded from the medieval domain. Although this division may seem artificial, the medium of production does imply a different approach to the diffusion of texts. Early printed texts in Italy were produced in multiple copies, and they were offered for sale, perhaps after an oral presentation in a public square, to a public that may have been more interested in the curative powers of the saints than in the possibility of repeated readings and recitations. That distinction is also made here, even though there may be some overlapping (e.g., a late manuscript copy might have been the model of a printed text, and thus the same text may appear in both categories).

By first considering manuscript versions of poetic texts, we can identify, among the several dozen lives that have come down to us, those of saints who lived in the first centuries of the Christian era: Catherine of Alexandria, Marguerite of Antioch (considered from the point of view of the quantity of versions transmitted, these two, along with the Alexis poems, are the most popular), Agatha, Christina, Helen, Euphrosina, Lucy, Mary the Egyptian, Ursula, Andrew, Anthony,

Bartholomew, Christopher, Eustace, George, John the Baptist, John Chrysostom, John the Evangelist, Julian, Gregory the Great, Laurence, Nicholas of Bari. From more modern times there are Bernardino of Siena, Francis, Roch, Silvester of Carnaldoli, and Torpete.

Different categories of saints can be identified here. One category is the traditional group of virgins and martyrs, frequently mentioned in the Bible (e.g., the apostles) and during the early centuries of Christianity. A second group is of special interest to Italians in general or because these saints are venerated locally: Francis, Bernardino, etc. A third group consists of apocryphal saints: Julian, George, Mary the Egyptian, etc. The best-known lives, those from early Christianity, often illustrate abnegation, sacrifice, determination, and valor. Because of their convictions, these saints, when confronting diabolical pagans of evil intent, often suffer torture administered with shocking cruelty; but through their valor and divine aid, they prevail and take on the role of intermediaries. The local saints do not necessarily undergo torture, but they nevertheless display courage and can inspire patriotism. Lives of saints in the third group—the apocryphal saints—are characterized by the great imagination the anonymous authors bring to these works, relating incidents that can scarcely be believed. Examples are Mary the Egyptian, beloved by many in many countries, a beautiful pagan but ugly Christian, who lived for decades in the desert; Julian, who killed his parents; and George, who slayed a dragon. In this group are saints of both sexes who belonged to a legendary or mythical world that was not necessarily Christian but who had enough of a Christian dimension to inspire veneration, at least in the medieval period.

The forms of these works vary. Some are composed in epic-type stanzas early on (Alexis is a case in point), then in four-line stanzas or rhymed couplets, or more frequently in the fifteenth and sixteenth centuries in stanzas of six or eight lines. As a whole, a work can be long (one life of Saint Catherine has 1,769 verses) or short (perhaps several dozen eight-line stanzas).

One life (the first in Italian), that of Alexis, will illustrate the diversity in the development of a single legend. The *Ritmo di Sant'Alessio* (early thirteenth century) begins:

Dolce, nova consonanza

*facta l'aio per mastranza
et ore odite certanza
da qual mo mostre semblanza
per memoria retenanza
Lu decitore se non cansa
se nne avete dubitanza
mon vo mostra la claranza
a li dubitanti per privanza
poi li disi per usanza
tansi in altitudine et finivi, co ...,
et dussi et poi complevi. (verses 1-12)*

Some elements—*odite, per memoria retenanza, lu decitore, din*— may indicate that this story was transmitted orally, by recitation to a group, and that it was to be committed to memory. The outline of the story is as follows: a powerful Roman, Eufemiano, and his wife are childless. Through much prayer, they produce Alessio, who is dedicated to God. He spends his youthful years in study. When he reaches the age of marriage, his father provides him with a spouse. On the wedding night, in the bridal chamber, Alexis beholds his beautiful bride, sees the bed, and his thoughts **turn** to God. He flees from Rome and spends seventeen years in the Middle East as a beggar. His mortification has made him unrecognizable; and finally he dies in a state of sanctity: *ket rnultu plaque ad Deu lu so servitiu* (257).

The second version of the tale, that of Bonvesin da la Riva (fourteenth century), has 524 lines arranged in alexandrine stanzas. With Bonvesin, we have a more elaborate narration, which is closer to the one transmitted in an eleventh-century French version. The beginning is the same as that in the *Ritmo*; but after his seventeen years as a beggar, Alexis returns to Rome, where he spends another seventeen years—still unrecognized— under the staircase in his father's house. Just before dying, Alexis writes his life story. The readers of this document learn who this saintly man really is; and with his help the city of Rome is saved—as we all will be saved if we imitate his way of living.

In a manuscript dated 1439, we have a tale that is more elaborate still, and unusual in that the form blends verse and prose. Additional narrative elements have been grafted onto the tale, turning it into a type of chivalric story quite different from the earlier versions. In this

version, which had much success in Italy, as Alexis leaves home, he runs into the devil, who gives him false information and attempts to dissuade him from carrying out his journey. The devil then speaks to Alexis's wife and later tells Alexis that his wife has betrayed him. Fortunately, an angel helps Alexis distinguish truth from falsehood. After a fifteen-year absence, Alexis returns home (again unrecognized); he dies seven years later. A few miracles occur, and the poem concludes with an exclamation by Alexis's mother: "Why did you do this to your family, staying with us without revealing who you are?" Afterward, four saints in the region are saved.

A great change has occurred from the first version of this story to the third: spiritual elements recede into the background, and adventurous episodes are tacked onto the original framework. As noted above, the third version had great success in Italy. It was recast in stanzas of six or eight lines, and it also provides us with a great number of printed texts—almost a dozen separate renderings before 1600. The original, sparse tale was still told, however, since we have an early printed text dated 1495.

The story of Alexis illustrates what could be done in this genre. It was originally written in Italian in a certain form for a certain purpose. It was then expanded to a version that can be seen as better balanced and more carefully structured. Finally, extraneous elements were inserted in order to appeal to the popular imagination and reflect what was in vogue at the time. The overriding purpose, though, is to portray the virtues of abnegation and self-sacrifice, in the best and most striking way possible. Other very popular texts—the stories of Catherine and of Saint Marguerite, whose lives were retold many times throughout the Italian Middle Ages—would also illustrate such changes in taste over the centuries.

This same tendency to produce a fashionable text can be seen in other works in this genre. Moreover, with the advent of printing, different means of bringing ideas to a wider group emerged. Alongside the early printed texts that transmit more or less substantial works in eighty or ninety 8-line stanzas (or more), we also find shorter and cheaper texts of twenty stanzas or fewer, with an abbreviated version of the life accompanied by prayers. (Texts that are chiefly prayers, without the life of the saint, do not enter into consideration here.) Many of the

more modern texts are editions by *cantastorie* (storytellers), who made their living by reciting these legends in public squares and then selling them, perhaps as a cure for various illnesses. These versions, printed on cheap paper, were sold in great numbers; but because of the cheapness of the paper, many have probably not come down to us. More elaborate and luxurious texts were also produced (though these too were frequently recited by *can-tastorie*), and a significant number of them can be found in important incunabula collections in Italy. In general, the same saints appear in printed texts as in manuscripts, but there are also new and sometimes more dramatic stories.

In many of these productions, we would not expect to find superbly written stories or delicately nuanced psychological presentations of the main figures; still, even modest productions can contain moments capable of charming us. The story of Maria Maddalena in an early printed text is a case in point. A simple description of a young woman with certain predilections could have been provided; but instead, the tale describes her in this way:

*Era fanciulla e ai belleza molta
piu ch 'alcun 'ultra donna orientale
vaga negli occhi e nel parlar disciolta*

*vaga di feste per theatri e sale
molti facea cascar piu d'una volta
in pensier tristi e fantasie carnale
spesso adornata si facea vedere
che d'esser vagheggiata bavea piacere.*

*Usava unguenti di molto valore
et nobil acque d'odorifera herba
e cost con gran pompa usciva fuore
tutta lasciva et nal'andar superba
rendeva il corpo suo st grande odore
ch'baria indolcita ogni misura acerba
in modo tal che quando fuori usciva
tutta de terra a vederla corria.*

Other tales are striking because of their outlandishness: examples include Saint Alberto (from before 1556), who is tempted by the devil disguised as a beautiful girl; and Saint Basil (in a poem from 1496).

There is also the story of Saint Theodora, who commits adultery; cuts off her hair and transforms herself into a monk, brother Theodore; and lives in a monastery. A young woman falls in love with "Theodore" and is rebuffed; she becomes pregnant by another man and accuses "Theodore" of being the father. The truth is revealed when Theodora dies. There are a number of imaginative texts of this type.

It should be noted that poetic texts have not been easy to find. Indeed, to obtain a sense of the genre one has to read the texts as they are found today in incunabula collections (in Rome at the Vatican Library, the Biblioteca Casanatense, and the Biblioteca Corsiniana, for example; and at the libraries in Florence, Milan, and elsewhere), using Cioni (1960, 1963a, 1963b) as a guide, supplemented by other sources. Only a few of these texts have been published, and even the published versions are not easy to locate, since they were printed for unusual circumstances (e.g., one was a wedding gift in the mid-nineteenth century).

To study the prose tradition has been even more difficult, because for some time there were not enough modern bibliographical tools to guide the researcher. Some tools were available (e.g., Zambrini 1855, 1861, 1884), and there were compilers dedicated to the genre; but even bibliographies could be difficult to pin down. The chief value of prose texts, aside from their legendary and linguistic aspects, was that they might occasionally shed light on events in the life of a saint that would be useful in a certain locality. Today, however, we do have the tools to study the prose genre as a whole and to study individual lives in particular.

Recent decades have brought changes in the direction of re-search—for example, in the work of historians who are interested in the process of canonization or in representations of femininity. A good number of the texts of interest to such researchers are in prose (e.g., the lives of Chiara da Romini, Corrado Gonfalonieri, and Angela da Foligno). Since no thorough research could be carried out without more modern tools, research teams were brought together at the École Française de Rome and the Fondazione Ezio Franceschini in Florence. The work and the results of these establishments have been described in articles by Dalarun (1994a,b), Dalarun and Leonardi (1997), and Dolbeau (1994). With the CD-ROM and appended tools (*Biblioteca Agiografica*

Italiana: Repertorio dei testi agiografici in volgare, secoli XIII-XV and its website), researchers can obtain a much clearer idea of the corpus, as well as many details of lives and texts. For the first time, students of the genre can focus on a text or a group of texts; gain a sense of the extent of the production; and carry on textual, literary, historical, and cultural research. Extensive work has already been done for other literary traditions (e.g., English, French, and German); this is now an exciting possibility for Italian as well.

Salerno

The city of Salerno, on the Tyrrhenian coast some 40 miles (64 kilometers) south of Naples, is perhaps best-known today as a site of landings by Allied forces during World War II. For four centuries, however, Salerno played a major role in the history of medieval Italy.

During the Roman imperial era, Salernum had enjoyed at least modest importance because of its location. Situated on an open plain just south of the mountains that ring the Bay of Naples, Salerno functioned as a gateway both to Calabria and to the southern Italian interior. Paestum, below Salerno on the same coastal plain, had been the major local center in the earlier Greek period, but it was then

already in decline; in effect, Salerno served the Romans as Paestum had served the Greeks.

In the fifth and sixth centuries, Salerno was one of many southern Italian cities fought over by Ostrogoth and Byzantine armies. Then, in the mid-seventh century, it fell to new invaders, the Lombards, and was incorporated into the newly created Lombard duchy of Benevento. At first, thereafter, the Lombards seem to have paid Salerno scant attention, even though it was nominally under their control. It was seldom mentioned in the sources; and since disease and famine swept southern Italy during the next century, its population surely declined. But in the 780s, Salerno's fortunes changed, quite dramatically. In 774, Charlemagne had invaded northern Italy and made it part of his empire, deposing the Lombard king. That left only the duchy of Benevento as an independent Lombard territory. Yet "only" is somewhat misleading, for in the late eighth century the duchy of Benevento could be said to encompass almost all of mainland Italy south of Rome—in other words, roughly half of the Italian peninsula. (In this period, Byzantium, while still claiming southern Italy, had virtually ceased to have any presence there.) Arichis II, the reigning duke of Benevento, was determined to protect his holdings; he now declared himself "prince of the Lombards" and set about strengthening his position lest Charlemagne decide to march south. And perhaps because the city of Benevento seemed too close to the Carolingian armies, or simply because of Salerno's strategic coastal location, Arichis made Salerno a second capital.

It is apparently to Arichis that we owe the refortification of what had been a Roman *castrum* on the heights above Salerno's present-day site. (Later expanded and further strengthened, this "castle" can still be seen from the *autostrada* as one approaches the city.) Lower down, moreover, Arichis built a palace and a royal church, and ringed the whole with stout city walls. From then on, until his death in 787, he seems to have spent much of his time at Salerno, as did his immediate successors, the Bene-ventan Lombard rulers of the early ninth century.

In due course, however, Salerno's enhanced position led to tensions among the Lombards themselves. In 839, when there was dissatisfaction over the succession to the Beneventan throne, a Salernitan Lombard faction installed its own rebel prince at Salerno. The result was ten

years of brutal civil war, with both sides hiring Arab mercenaries with which to ravage each other's territory. Inevitably, this alarmed the pope; Rome itself seemed threatened by this importing of Arabs. The battling had to be stopped; and so in 849, prodded by the Carolingian emperor Lothair (Lothar) I at the urging of the pope, Benevento's ruler was forced to agree to a formal separation. (The document, *Divisio ducatus beneventani*, still survives.) The old duchy of Benevento was cut into two parts, with Salerno acquiring title to most of the western half of southern Italy.

Thereafter, Salerno—now officially the autonomous principality of Salerno, with the city of Salerno its capital—grew and flourished. A particularly strong dynasty soon assumed power there and produced a succession of able, long-lived, and popular rulers. By the end of the tenth century, the principality of Salerno was unquestionably the richest and most stable political entity in the south.

There were, of course, some problems along the way, and some obstacles to overcome. In the latter ninth century, Capua, initially part of Salerno's domain, also became autonomous. This meant a third Lombard principality vying for power in the region, and for a time Benevento, Salerno, and Capua intermittently battled each other, sometimes drawing into their confrontations the duchy of Naples, their non-Lombard neighbor. In the 870s, the city of Salerno was also besieged for nearly a year by a formidable Arab army intent on extending North African control to southern Italy. (The city was finally saved only because the Carolingian emperor Louis II dispatched a rescue force.) Then, in the 880s, Byzantium, which had neglected its claim to southern Italy for nearly a century, once again sent armies there. From that point on, through the tenth century and into the eleventh, Salerno always had to be wary of the Byzantines' challenges to its independence.

Yet the principality proved strong enough to withstand all of these threats. In the latter tenth century, there was a change of dynasty, largely due to the turmoil associated with the emperors Otto I and Otto II and their forays into southern Italy. Capua's ambitious ruler, Pandulf Ironhead (Pandolf or Pan-dulph I), associated himself with the Ottos and even succeeded, briefly, in obtaining Salerno's throne for his son. But Salerno survived this turbulence too. The Salernitans recruited a

new ruler, from Spoleto, and this new dynasty continued the policies of its predecessors, even adopting the names of the old rulers (Guaimar, Gisolf)- The principality thus remained strong, and notably prosperous. In the ninth century, a close relationship had been formed with Amalfi, the trade-oriented city-state that was Salerno's nearest neighbor. This appears to have contributed significantly to Salerno's prosperity. Both Amalfi and Salerno clearly benefited from trade with the Arab world, as is indicated by the fact that in the tenth century both states adopted an Arab coinage, the gold *tari* or quarter-dinar.

By the time of Guaimar V (1027–1052), however, there were clouds on the horizon. All the sources indicate that Guaimar V was an exemplary ruler: a vigorous defender of his principality, and an adroit politician who was nonetheless also admired throughout the region for his exceptional integrity. But southern Italy in his period was increasingly chaotic. Early in the eleventh century, Norman adventurers had begun to appear there, lured by an escalating conflict involving Byzantium, a resurgent papacy, successive German emperors, and the Lombards. Contemporary sources reported that it was in fact Lombards (possibly including Guaimar's own father) who had first urged Norman mercenaries to come south, mainly to help fight off the Byzantines. Certainly the Normans formed their first power bases in Lombard territory and began to intermarry with the Lombard ruling families. Soon, however, these Normans became even more ambitious and aggressive. By the time Guaimar V died, one set had wrested control of the Lombard principality of Capua. And Benevento, terrified of a similar fate, had declared itself a papal city or papal ward, surrendering its autonomy.

At first, Salerno looked likely to escape unscathed. In 1058, Gisolf II, son of Guaimar V, married his sister Sikelgaite (Sichel-gaita) to Robert Guiscard, by then the preeminent Norman. This alliance seemed to assure Salerno of a strong and independent future. But then less than twenty years later, in 1075, Robert Guiscard turned on his brother-in-law and seized Salerno's throne for himself.

By then the Normans were well on their way to creating the Norman Regno, their kingdom of southern Italy and Sicily. In 1071, Robert Guiscard had taken Bari, Byzantium's chief city in southern Italy; in 1072, his brother took Palermo, the capital of Muslim Sicily. Salerno, the

sole surviving Lombard principality, had constituted the last major impediment to their control of the mainland

After 1075, there was no longer an autonomous principality of Salerno, but within the Norman Regno at least the city remained important. Robert Guiscard built there a splendid new cathedral (which still stands, even though its interior has been much altered over the centuries). The city became, in effect, the Normans' mainland capital; and even in the twelfth century, when the Norman court was based in Sicily, Norman rulers made frequent visits to Salerno, and several Salernitan Lombards held important offices in the Norman state.

But then the Norman kingdom collapsed, at the end of the twelfth century. The last member of Robert Guiscard's royal line died in 1189, leaving no son, and the throne was claimed by Henry VI, the German emperor who had married a daughter of the Normans' greatest twelfth-century ruler, Roger II. Many supporters of the old Norman dynasty opposed Henry's claim, and an illegitimate cousin of the last Norman ruler was crowned instead. But within five years, after a bloody and devastating struggle, this attempt to preserve Norman rule collapsed. Henry VI won, and that proved to be the end of Salerno's centuries of prominence, for Salerno had openly sided with Henry's Norman opponents and, in punishment, the city was virtually razed.

Salerno's great period thus came to an ignominious end. Frederick II, Henry VI's son, favored other cities in southern Italy, and later rulers of the region, the Angevin kings of the thirteenth and fourteenth century, made Naples their capital. Salerno sank into obscurity; in later centuries, it was known only as a center of medical learning.

Yet in fact this reputation did reflect a connection with Salerno's earlier days. The medical school of Salerno achieved its greatest celebrity during Salerno's Norman period, after the principality had ceased to exist; most of the Salernitan medical treatises that circulated throughout Europe are dated to the twelfth century. Nevertheless, the beginnings of the school can be traced to the Lombard period. In the late tenth century, for example, a bishop from northern France had journeyed to Salerno in hope of a cure. At the time, Salernitan doctors were disparaged by some as overly pragmatic and insufficiently theoretical; but this may well have been what drew the bishop, and this predilection would remain a hallmark of Salernitan medicine. It is also

notable that the most distinguished figure associated with the Salernitan school was Constantine Africanus, a converted Muslim who translated medical treatises from Arabic into Latin. If we remember that Lombard Salerno had a close trading relationship with the Arab world, we should not be surprised at Constantine's coming there in the late eleventh century. All together, it seems fair to say that Salerno's later reputation represented a genuine link with the old principality.

With the exception of its medical school, Salerno has been almost totally neglected by British and American scholars; but for a full discussion of Lombard Salerno, see Kreutz (1991).

Salimbene De Adam

What we know of Fra Salimbene de Adam of Parma (1221-c. 1289) is based entirely on the *Chronicle*, his only extant work. In it Salimbene tells us that he was born to Guido de Adam and Inmelda de Cassio,

members of two well-established families in Parma. He was christened Balian of Sidon but was simply called Ognibene by his family. In 1238 he entered the Franciscan order and was given the name Salimbene by the last friar Saint Francis had admitted to the order. During his novitiate, Salim-bene met Bernard of Quintavalle, the first friar Saint Francis had admitted to the order; and Elias of Cortona, the order's first minister general.

After completing his novitiate at Fano, Salimbene went to a convent in Lucca where he studied music and first saw the Holy Roman emperor Frederick II. From there he moved to Siena, where he continued his study of music and came into contact with the theories of Joachim of Fiore through the work of Hugo of Digne. From 1243 to 1247 Salimbene was in Pisa, where his education in Joachism continued under Rudolf of Saxony. Salimbene's acquaintance with some of the most distinguished people of his time continued during his trips to France in 1247-1248. At Provins he met the Joachist Gerard of Borgo San Don-nino. At Villefranche and at Sens he met Giovanni di Piano Carpini, the Franciscan provincial general of Germany and Spain, who had been an emissary for Pope Innocent IV at the court of the khan Guyuk at Karakoram in Mongolia. At Hyères Salimbene heard the lectures of Hugo of Digne, and at Auxerre he met Saint Louis of France. In 1248 he was ordained a priest at Genoa; later he was sent to Ferrara, where he remained for seven years. He probably spent the years 1279-1285 in Reggio Emilia and its province, where, in 1283, he began working on the *Chronicle*. In 1287 he moved to Montefalcone, where he died shortly after 1288.

Despite his close contact with several of the leading thinkers of his time, and despite the opportunities to study at several of the most important universities of his day (he spent a week studying at the University in Paris but left without the permission of his superiors), Salimbene's intellectual background is regarded by scholars as superficial. His knowledge of the Bible was thorough, as is shown by his extensive use of biblical quotations throughout the *Chronicle*, but as scholars have indicated, these quotations are used to support statements which often have little if anything to do with the Bible. Scholars concur that even when Salimbene discusses issues about which he was knowledgeable (such as the prophecies of Joachim of Fiore and

the relative merits and shortcomings of Elias of Cortona), he is often subjective and biased.

Salimbene's numerous acquaintances and travels provided him with plenty of material for his *Chronicle*. Besides narrating famous and less-known events in Italy and France, the *Chronicle* also narrates personal moments in Salimbene's life and that of his family. The *Chronicle* is regarded by scholars as historically accurate for the most part, but its importance is not purely historical. As Baird (1986) has shown, it is the earliest account of the spread of Joachism within the Franciscan order, as well as an important document of Franciscan life in the thirteenth century and the extent to which the Franciscan order had deviated from Saint Francis's original rule. Salimbene does not hesitate to reveal his own worldly interests while narrating the worldliness of his age. His narrative, however, also includes *exempla* of spiritual piety, as seen in his characterizations of Saint Louis of France, John of Parma (minister general of the Franciscan order), and even himself (Salimbene's visions of the holy family are narrated in great detail). In fact his extensive use of *exempla* gives the *Chronicle* a narrative style that anticipates Boccaccio's *Decameron*. The *exempla* are an integral part of the *Chronicle* and are used not only to illustrate a moral but also to produce comic effects. Moreover, these *exempla* are rich in detail, making the characterizations both vivid and realistic (Auerbach 1957),"

In addition to vivid portraits of well-known and lesser-known people of his time, Salimbene himself often appears in the *Chronicle*, giving the work an autobiographical dimension. He comes across as having a great interest in worldly matters, and (as Baird notes) he often expresses contempt for qualities he himself is guilty of, indicating a contradictory or ambiguous personality. Nevertheless, Salimbene's candid and uninhibited nature suggests that he is true to himself throughout the *Chronicle*, even when his evaluation of others (e.g., Elias of Cortona) is not as truthful.

The *Chronicle* has come down to us in a single manuscript (Vatican Latin 7260) of which the first 277 folios are missing. The manuscript, written by Salimbene himself, narrates events from 1168 to 1287. The years 1168–1212 are based on Sicardo of Cremona's *Chronicle*; and the historic events occurring from 1212 to 1283 (the year Salimbene began writing the work) seem to have much in common with two chronicles

attributed to Albert Milioli: *Liber de temporibus* and *Cronica imperatorum*. Not until the twentieth century did Salimbene's *Chronicle* receive the scholarly and critical attention it deserves.

Salimbeni Family

The Salimbeni family was the wealthiest noble lineage in Siena during the regime of "the Nine" (1287-1355). The Salimbeni had extensive urban and rural possessions and were the directors of a prosperous banking firm. Before the mid-thirteenth century, several members of the family were apparently Ghibelline. In 1260, for example, Salimbeni dei Salimbene offered 118,000 gold florins to the mercenaries needed by the commune of Siena for the battle of Montaperti (1260). After the mid-thirteenth century, however, the family became dependable Guelphs. Like many other magnate houses, such as the Tolomei, Malavolti, Piccolomini, Marescotti, and Bonsignori, the Salimbeni were excluded by Sienese law from membership in the *popolo* and were declared ineligible to serve in the Nine. Nevertheless, they exerted considerable economic influence over the affairs of their city. For example, several of them served in the most important financial magistracy of Siena between 1287 and 1355, the *biccherna*. The Salimbeni were considerable landholders in the city and the surrounding countryside (they had several rural *castelli* and the lordship of Rocca d'Orcia, or Tintinnano). Their successful banking house survived the series of bankruptcies in the early fourteenth century that affected the Bonsignori, Malavolti, and Tolomei establishments. The Tolomei were the principal rivals of the Salimbeni from the mid-twelfth century to the early fourteenth. In the second half of the fourteenth century, the Salimbeni divided into four separate branches.

Salutati, Coluccio

Coluccio Salutati (1331 — 1406) was born at Stignano, on the frontier between Ghibelline Lucca and Guelf Florence, and was carried into exile when the Ghibellines seized power in the area shortly after his birth. He was raised and educated at Bologna, where he studied under Pietro da Moglio, a member of the third generation of Italian humanists. Salutati was trained as notary and in 1350-1351, after his father's death, he returned to Stignano with his family and began practicing his profession. Between 1351 and 1367 Salutati earned his living as a notary, but by 1356 he was already playing a major political role in the rural commune of Buggiano, of which Stignano formed one

of four villages. He married a local woman, Caterina di Tomeo di Balducci, in 1366. In 1367 he moved to Todi to become its chancellor; in 1368 he moved to Rome, where he worked in the papal chancery under Francesco Bruni. After being unable to find suitable employment with the papacy, Salutati became chancellor of Lucca with Bruni's help in 1370. Almost immediately, however, he became embroiled in a factional dispute, and in 1371 he lost his position and reluctantly returned to Stignano. He had lost his first wife while he was still in Lucca; sometime between 1372 and 1374, widowed with a small boy, he married Piera, the daughter of Simone Riccomi. He and Piera had at least eight children.

Salutati was called to Florence in 1374 to assume the newly created secretaryship of the *tratte*, the office supervising elections to Florentine offices; in 1375 he became chancellor. As the official responsible for conducting the Florentine government's correspondence with the provinces and with foreign powers, he almost immediately established his reputation as the greatest author of official letters in western Europe. He was able to demonstrate his virtuosity immediately, because 1375 marked the beginning of a three-year war between Florence and the papacy, a war whose major battles were propaganda campaigns designed to retain and attract allies. Perhaps his greatest epistolary triumphs came in 1390-1406, when he assumed responsibility for representing to western European powers the issues involved in Florence's bitter struggle with the Visconti of Milan. Florence's archenemy, Gian Galeazzo Visconti, is said to have stated that "a letter of Salutati's was worth a troop of horses." Having been chancellor for thirty-one years, during which time he navigated the troubled waters of Florentine political life with unerring tact, Salutati died in 1406.

Salutati was influenced, after 1367, by Petrarch's concern with integrating Christianity and pagan letters, but he never achieved the mature Petrarch's confidence in their harmoniousness. Salutati, who is less classicizing in style than Petrarch and more obviously intrigued by scholastic philosophy and theology, betrays the weak welds in Christian humanism. Although he was a family man and a devout Florentine patriot, his *De seculo et religione* (1381), praising the superiority of the monastic life, represented a genuine ascetic element in his thought. His last private letters unambiguously affirm his allegiance to Christian

truth over and against pagan culture. Nonetheless, up to the last year of his life his devotion to ancient literature remained strong. Under his influence, Florence brought the great Greek scholar Manuel Chrysoloras from Constantinople in 1397 to teach Greek at the university. Whereas a previous attempt in 1360— 1362, with Leonzio Pilato, had failed to arouse the interest of the city's young people, the arrival of Chrysoloras marked the rebirth of Greek studies in western Europe

Salutati made Florence the capital of this major movement in European cultural and intellectual life through his prestige as chancellor; the fame of his public letters; his eagerness to relate classical studies to moral and religious problems of his day; his effort to encompass within a continuous tradition the ancient Latin authors, the church fathers, and the medieval rhetoricians; and his successful introduction of Hellenic studies into the Latin west. That Florence was the center of humanistic studies down to the mid-fifteenth century testifies to Salutati's enduring intellectual legacy.

Situated in the Val d'Elsa about 35 miles (56 kilometers) from Florence and 23 miles (36 kilometers) from Siena, medieval San Gimignano was at the crossroads of the main route northward from Rome and the route from Pisa to Siena. It was arguably the most important town between Lucca and Siena. Today San Gimignano is the serene "city of the beautiful towers," the best-preserved example of a picturesque Tuscan hill town. Much of what one encounters there, especially the unique collection of fifteen medieval towers, dates to the thirteenth century and the early fourteenth, an era that was prosperous but hardly peaceful. The now quaint pavements once soaked up blood, reflected the incendiary's torch flame, and echoed the partisan shouts of Guelph and Ghibelline and the cries of the victims of both. The rich countryside brought prosperity, and prosperity begat ambition, rivalry, and violence.

The existence of Etruscan tombs and other archaeological evidence indicates that the area in and around San Gimignano was occupied in pre-Roman and Roman times, though little is known about early settlement. Ancient traditions associate the site with followers of Catiline and link it to events in the lives of Attila the Hun (impossible), Totila, and Desiderius, the last native king of the Lombards. The earliest documentation of the area is from 929, when the king of Italy presented lordship over one of San Gimignano's hills—Monte di Torre—to Adalard, bishop of Volterra. Unlike most important Tuscan towns, San Gimignano would never have a bishop of its own; nor would it ever be dominated by local or territorial feudal lords, as so many similar towns were. The lordship of a distant (and often preoccupied) bishop provided many opportunities for civic self-determination.

On his hill, the bishop of Volterra built a *castello* as a residence when he was in the area. This, with its church of Santo Stefano, became one of two nodes around which the town of San Gimignano grew after the mid-tenth century. Along the flank of the rise on which the *castello* stood ran the Via Francigena, since Lombard times the major route for trade and travel between Rome and northwestern Europe. Closer to the road and slightly to the west rose a second hill, Montestaffoli. This supported a small settlement, or *borgo*, that had long been associated with a relic of the fourth-century Modenese bishop San Gimignano. The *borgo* grew during the Carolingian period, and the bishop sanctioned its

church (San Niccolo), *castello*, and market. From early on, the *borgo* provided for pilgrims to Rome, merchants, and other travelers along Via Francigena. Hospices and other services developed to care for their needs. By the late 900s the *borgo* had walls, and in 1059 San Gimignano's oratory became the area's *propositura*, or seat of the local provost.

The bishop excluded his village, later known as the *castelvechio*

(old castle), from the new town, probably wishing to maintain the freedom of access this would ensure. As lord of the area, the bishop ruled through a *vicedominus*, or vice-lord, and later a rector. To aid the bishop's representative, and to represent the townspeople's interests to the bishop, a number of *boni homines* (good men) were chosen from the most important families. This group provided a core for the formation of a separate government of the town, one eventually independent of the bishop's interests or desires. Ironically, bishops began to urge or force rural nobles to reside in San Gimignano itself. This provided the town with new and powerful leaders and stronger connections to the countryside; a true community of interests emerged, at the bishops' expense.

The twelfth century witnessed the rise and triumph of the commune of San Gimignano over its lord bishop. In 1100, there was a clerical uprising, and the Tuscan countess Matilda reconfirmed the lordship of the bishop of Volterra over San Gimignano. In 1199, the communal council chose its own *podestà*, whose function was, effectively, to replace the bishop's rectors and end the bishop's rule, if not his authority. The bishops were engaged in an endemic struggle with their own people in Volterra, which meant that the churchman needed allies and money, and both could be had from San Gimignano, for a price. On the one hand, the leading citizens of San Gimignano wanted freedom from interference by the bishop in economic affairs and political relations with other communes. On the other hand, they wanted to expand their influence over the countryside— that is, over territories held directly by the bishop. As communal organization became more sophisticated, the demands grew. By 1181, the bishop's rector was being advised, and confronted, by a communal government led by four consuls (direct descendants of the *boni homines*) and a council of fifty. These were powerful men of commerce, not feudal nobles as in many communes, and their understanding of the bishop's position was clear. He had to pay interest of 20 to 30 percent for San Gimignese money, and yet he relied on the town's goodwill; concessions were inevitable.

In 1199, the communal councillors named as first *podesta* the Sienese Maghinardo di Malavolti. In the same year, they "allied" themselves with the lords of Montignoso and of Castello Fosci for military purposes. These were not really alliances but submission disguised, for

political reasons, as something less threatening to the bishop's interests. When Castello Fosci rebelled in 1204, San Gimignano showed its teeth: it utterly destroyed Castello Fosci but welcomed the lords, Sigerio and Antiochia, as full citizens. In 1210, the bishop's impecuniousness forced him to sell his rights to the *castelveccio*, though it remained outside the town walls until 1262. Independent action had its price, however. In 1202, Florence decided to wipe out the stronghold of the Alberti clan at Semifonte, and the commune of San Gimignano supported the small town, hoping to keep the powerful Florentines at a distance. San Gimignano lost the gamble, and Semifonte was eliminated. The San Gimignesi, led by a Florentine *podestà*, switched sides in time to participate in the destruction, however; and Florence exacted no revenge for their original opposition. The Florentines did demand that all men aged sixteen to seventy swear allegiance to Florence and fight for its interests, and that the commune protect the interests of Florentines in San Gimignano's territory and pay an indemnity of 2,000 lire.

Several trends that were important for San Gimignano emerged in the first half of the thirteenth century. It continued to extend its hold over nearby *castelli* and towns; it became more involved with Florence; and rivalry between Guelfs and Ghibellines began to develop. Actions of Emperor Frederick II led first to opportunistic gains at the expense of the bishop of Volterra. In 1224, Frederick reconfirmed the bishop's powers, angering both the Volterrans and the San Gimignesi. However, in 1225, when violence by Volterrans resulted in the death of a San Gimignese, the commune supported the bishop. San Gimignano occupied several of his feudal holdings so as to "protect" them, and in 1226 it besieged Nera. One of these holdings was Montevoltraio, a short 3 miles (about 5 kilometers) from Volterra. San Gimignano had to evacuate Montevoltraio after arbitration but left a *podestà* in place. Emboldened by its victories, in 1229 San Gimignano persuaded Montignosi, Pietra, and Gambassi to shift allegiance. Arbitration followed a short war, and the bishop exchanged an important tax right for control of the properties. With the emperor's help, in the mid-1240s San Gimignano regained Montignosi and Gambassi. In 1253 the bishop once again was willing to trade territory for fidelity and resources, as he faced a major popular revolt in Volterra.

Palazzo del Podestà, San Gimignano. Photograph courtesy of Christopher Kleinhenz.

Another important trend is that Florence and San Gimignano grew closer politically. Florence served as a mediator in many disputes involving San Gimignano, and San Gimignano supported Florence in its wars against its neighbors. As Guelf and Ghibelline factions emerged during the reign of Frederick II, San Gimignano was split, and the Guelfs inevitably looked to Florence. The rift also resulted in a long and bloody civil war between the factions, eventuating in Florence's

domination of San Gimignano in the mid-*Trecento*.

In 1241, San Gimignano was forced to submit to Frederick and accept his *podestà*. In 1242, the captain general in Tuscany imposed taxes on the normally exempt clergy, and banned San Gimignese Guelfs and sequestered their goods. This led to open war between the Guelf clan of the Ardinghelli and the Ghibelline Salvucci. Until 1250 San Gimignano was strictly Ghibelline, and it put down a revolt by the Ardinghelli in 1246. With the emperor's death came a mild Guelf resurgence, and in 1251 the *popolo*, largely Guelf, seized the upper hand in the government. As early as 1233, the *popolo* had gained official representation in one council; now two *popolo* captains, with the support of the bishop, attacked the imperial *podestà* and established rule by twelve captains from the *popolo*. This new government also sent aid to Guelf Florence against its Ghibelline enemies. The Ghi-bellines (the Buonfiglioli family) struck back in 1252 and massacred Guelfs. Peace was made at the expense of the Ghibellines, so they rose again in 1253. Walls, gates, and houses were damaged or destroyed, and the Florentines, as mediators, demanded that the town walls be destroyed in punishment for the civil unrest.

San Gimignano remained Guelf until the Ghibeliine victory at Montaperti in 1260. Leading Guelfs fled to Lucca, and San Gimignano joined the Ghibeliine league. The walls were rebuilt in 1262, and these still define the city today. The Guelf victory at Benevento (1266) ended Ghibeliine domination in Tuscany. The San Gimignese *parte Guelfa* reorganized the government but reserved one-third of council seats for Ghibellines in an attempt to mitigate political violence. King Charles of Anjou, who was a Guelf leader and the overlord of San Gimignano, ordered the destruction of Ghibeliine towers in the town during another round of fighting with the bishop of Volterra over Gambassi. Continuing on its pragmatic course, the town refused and made peace, since such a move could have had negative economic consequences. With the destruction of the Ghibeliine stronghold of Poggibonsi in 1269, Tuscany was firmly Guelf, and the Ghibellines seemed to pose little threat. In fact, they gained the right to half of the council seats after 1278, and factional strife died down temporarily.

San Gimignano joined the Guelf league in 1284 and fought in the victory of Campaldino in 1289. The regime was again reorganized, this

time along strictly Guelf lines. An expensive war with Ghibelline Pisa in 1290 resulted in a tax on clergy in San Gimignano. The bishop of Volterra declared an interdict, and the clergy, taking church plate with them, walked out of the town. The commune charged them with theft, and the case went to the pope, who upheld the interdict. Shortly thereafter, however, the pope reexamined the case and lifted not only the interdict but the ecclesiastical tithe as well. Wealthy and Guelf, San Gimignano deserved careful treatment by Rome.

Florence turned on San Gimignano in 1293, taking control of Gambasss, Catignano, Pulicciano, and Montignosi, offering no explanation and showing no patience with arguments. This had the effect of reviving violence between the Guelfs (the Pellari) and Ghibellines (the Salvucci). By 1296, in protest, a number of communes, including Perugia, Arezzo, and Volterra, had lifted their protections for merchants from San Gimignano. This threat caused the factions to sue for peace, a suit mediated by the cardinal of Acquasparta in 1298. In 1300, a Florentine embassy, which included Dante Alighieri, came to San Gimignano to invite the town to join another Guelf league, and to begin accepting Florentine *podestà* once again.

San Gimignano battled Volterra again between 1306 and 1309 but joined and aided the Guelf and Florentine causes in 1309 and 1312-1313, when Emperor Henry VII passed through Tuscany and revived Ghibelline and imperial pretensions. San Gimignano supported the war against Ghibelline Pisa until peace was signed in 1318. Because of its strong economic ties with Lucca, San Gimignano at first stayed out of the skirmishes with the arch-Ghibelline Castruccio Castracani in the early 1320s. The defeat of the Guelfs at Altopascio (1325), however, emboldened disaffected Ghibellines and exiles, who plotted to overthrow the government. The plot was discovered and thwarted, and active support for the Guelf cause followed immediately. San Gimignano withdrew its merchants from Pisa, and Pisa's army fought its way as far as Pietra, devastating the San Gimignano countryside. Castruccio's death ended the campaigns, but the cost to San Gimignano was extreme: its trade was nearly ruined, its countryside was devastated, and it had to borrow 10,000 florins from the Florentine Acciaiuoli bank to buy grain for its famished populace.

Peace was brief; the appearance of John of Bohemia led to a

Ghibelline revival and to renewed bloodshed. Ardinghelli exiles fought to regain admission into San Gimignano but failed and holed up in Camporobiano, a possession of Florence. San Gimignano attacked and burned the town, and Florence demanded 50,000 florins and death by fire for 147 people who had been involved (the latter demand was withdrawn).

The Florentines' interest and power in the vicinity was growing, as Florence absorbed more and more of the Val D'Elsa in the 1340s. In 1344 and 1348, the Ardinghelli tried again to regain admission to San Gimignano, and again Florence was inconvenienced by the resulting violence. After the black death swept the region in 1347–1348, San Gimignano was prostrate, having lost about 60 percent of its inhabitants; only about 1,900 souls remained in the town. Feuding, campaigns, and the plague had exhausted San Gimignano, which now submitted itself to Florentine control, on 28 February 1349, for a period of three years. In 1351, violence between the Salvucci and the Ardinghelli led to a renewal of the pact, and the situation was repeated in 1352–1353. Finally, on 11 August 1353, San Gimignano made a full act of submission in the hope that Florence could bring internal peace. Native magistrates still had some power, but a Florentine *podestà* regulated virtually all civic affairs. San Gimignano could become members of Florence's guilds, but the town was subject to high taxation. Florence also built and manned a new fortress, the *rocca*, on the site of the Dominican house. This was completed in 1358 but is now in ruins.

Economy and Society

(The economy of San Gimignano was based on land, which tended to remain in the hands of rich magnates and fairly small holders. Grain, of course, constituted the mainstay of the diet and supported residents and travelers alike. Agriculture also provided export crops of exceptional quality. The most important was saffron, for which San Gimignano became very famous. Saffron was used for medicine, as a spice, and in dyeing wool, and it obtained the highest prices in markets throughout Italy and abroad. The region's wine ("Greco" and Vernaccia) and olive

oil were also highly regarded throughout Italy and brought merchants healthy profits. These profits became the bases for moneylending both within the town and, more important, abroad. The bishop of Volterra was a regular customer, and the city's merchant network provided agencies throughout Italy and in France. Rates of 20 and 30 percent were not uncommon, and, like good Christian usurers, the San Gimignesi shouldered and then expiated their guilt.

Unlike landholders elsewhere in Europe, those in and around San Gimignano notably reinvested much of their profits in the land itself. This guaranteed continued high quality and quantity of production, until the devastating wars of the 1320s. This capitalistic approach to agriculture developed in San Gimignano among a landholding class that was fully urbanized and that by the early twelfth century had made common cause with, and become an integral part of, the commercial class in the town. A rural nobility really did not exist, and the thirteenth-century family towers for which the city is so famous today were the strongholds not of knights recently forced into the town, as elsewhere, but of leaders in the mercantile and moneylending class. The obstreperous Salvucci and Ardinghelli were merchant-usurers, not merely unruly rural nobles who brought their feud into town.

Trade flowed from and through San Gimignano to Siena, Rome, and points south; and north to central Tuscany, Lombardy, and northern Europe along the Via Francigena, until the route of that road was shifted under the direction of the Florentines. Goods flowed into the Mediterranean through the port of Pisa. In the 1230s, San Gimignano built a *fondaco*, or warehouse-office, in Pisa for the use of its merchants. Some San Gimignesi developed transportation networks, carting the goods of merchants throughout Tuscany, usually in caravans. The San Gimignesi, of course, also taxed the passage of goods through their segment of the Via Francigena. In 1236, these *gabelle del passo* earned the commune about 1,000 lire. The lodging of travelers also grew as a local occupation, at least until the route shifted. In 1262 there were nine hospices, although there were only six in 1284 and 1298.

The crusades exposed many San Gimignesi to the possibilities of trade and banking in the near east and along the North African littoral. Entrepreneurs, money changers, and moneylenders from San

Gimignano could be found throughout the Mediterranean during the early thirteenth century, with a concentration in Syria.

The production of wool Cloth came late to San Gimignano. In 1274, three masters arrived from Florence and introduced the industry, and later that year Alessandro del fu Ugolino of Siena was given great concessions and communal support for setting up an operation. These businesses thrived, and wool cloth became a major export. Glassmaking was another craft introduced, through Camporobiano, into the town in the thirteenth century.

The development of guilds reflects the rise of San Gimignano's economic fortunes. In the mid-1230s, only the furriers, drapers, victualers, and shoemakers had guilds. By 1258, smiths, butchers, animal sellers, and carters had organized. Not until after this date did judges and notaries, merchants, producers of wool cloth, tailors, carpenters and masons, and barbers establish their guilds, while the drapers, furriers, and carters lost theirs.

Economic decline accompanied San Gimignano's political and military entanglements. These led to poor relations with Pisa and Lucca, to high military expenditures and indemnities, to high taxes, and to a wasted *contado* in the 1320s. The number of households (hearths) in the area grew until the time of the black death. In 1227, there were about 1,400 hearths, representing about 6,500 to 7,000 people. By the 1280s, the number of hearths had grown to 2,222; and fifty years later, in 1332, there were an additional 317. As a result of the black death, only 1,163 families—or about 4,000 people—remained in San Gimignese territory in 1350.

Monuments

The main road through San Gimignano today, from Porta San Giovanni to Porta San Matteo, is a remnant of the Via Francigena. The main squares through which the road passed are today the Piazza del Duomo and the Piazza della Cisterna. Communal buildings located in the Piazza del Duomo include the Palazzo Comunale (or Palazzo del Popolo), begun in 1288. Attached to this is the Torre del Podestà (or Torre Grossa), a civic tower nearly 180 feet (54 meters) high. The whole

structure was completed in 1311. The upper stories of the *palazzo* house the Museo Civico and the Sala del Consiglio, the room in which Dante addressed the commune in 1300. The *sala* contains a *Maestà* by Lippo Memmi (1317) that San Gimignano commissioned to rival Siena's. The Palazzo Comunale served as the residence of the Florentine *podestà* after 1353. The old Palazzo of the Podestà is across the Piazza del Duomo from the Collegiata church, and adjacent to the Palazzo Comunale. Built in 1239, this structure was originally the family residence of the Gregorio and later the Mantellini. It housed the town's *podestà* from the later thirteenth century until 1353. The Rognosa tower, about 165 feet (50 meters) high, was added in the early fourteenth century and served as a prison until the end of the century.

San Gimignano's principal church is the Collegiata, sometimes incorrectly referred to as the *duomo*. It originated in the twelfth century as a small oratory dedicated to Saint Nicholas; this was expanded in the early thirteenth century into a Romanesque basilica-style church. Pope Eugenius III is said to have consecrated the original oratory in 1148. Its frescoed interior contains thirteenth- and fourteenth-century Sienese work, including Old Testament scenes by Bartolo di Fredi and a Last Judgment by Taddeo di Bartolo. The church also contains the chapel of Santa Fina, a local girl who, after five years of suffering, died in the odor of sanctity (literally, according to tradition) in 1253 at age fifteen. The only remaining mendicant church is Sant'Agostino, a large structure begun in 1280 and finished in 1320, located near the Porta San Matteo. The Dominican church and convent were completed in 1332 but were destroyed when the Florentines built the Rocca two decades later. The Franciscan community was suppressed in 1782, and the rather small Pisan-Romanesque church of San Francesco on Via San Giovanni was desacralized.

Important private towers that remain intact from the thirteenth century include the twin Salvucci towers flanking the older Palazzo Salvucci, and the Torre Brogi Pesciolini, which legend claims was the palace of Desiderius.

San Miniato

San Miniato (*al Tedesco*) snakes across a long hilltop near the confluence of the Arno and Elsa rivers in central Tuscany. It was long the most formidable fortress in the lower Arno valley. According to legend, Desiderius, the last native king of the Lombards, built the original castle, and there is evidence for "seventeen Lombard founders." The earliest documentation (783) regards permission granted by the lord bishop of Lucca for the construction of a church dedicated to the Florentine martyr San Miniato. As the Via Francigena became the principal corridor linking Rome with northwestern Europe, San Miniato guarded a vital crossroads: the Francigena and the Arno valley between Florence and Pisa. A village grew up around the church and castle, and in the latter the future countess Matilda of Tuscany was born in 1046.

By the end of the eleventh century, a communal government had evolved in the town in the face of a new imperial presence. Delegates or vicars exercised control, and the chronicler Villani claims that in 1113 San Miniato was an imperial fortress. Under Frederick I Barbarossa, between 1160 and 1163, San Miniato became the center for imperial financial administration for both Tuscany and the duchy of Spoleto. The denotation *al Tedesco* ("German") resulted from the presence of many German imperial functionaries and soldiers. Relations between the townspeople and the representatives of the empire were often strained. In 1172, the imperial residence was torched by rebellious Tuscans, including Samminiatesi. Imperial troops were ruthless as they conquered the town in retaliation.

Duomo and bell tower ("Matilda's Tower"), San Miniato. Photograph courtesy of Christopher Kleinhenz.

The commune survived the destruction, and the town was rebuilt along the main road in three distinct sections, each heavily fortified against external attack. These served as urban forecourts to the imperial *rocca*, with its walls, towers, and gates that sealed it off from the town.

In the late twelfth century, the route of the Via Francigena was shifted, ruining business in the nearby town of San Ginesio. Frederick II completed the economic destruction (and aided San Miniato's development) when he formally repositioned the trade route toward San Miniato (in 1217) and moved the regional church functions (the baptismal font, cemetery, and chapter of canons) from San Ginesio to San Miniato in 1236. In 1240, after San Miniato aided hostile Florence, Frederick reneged on these arrangements, imposed an imperial governor, and destroyed civic towers. In frustration and retaliation, Samminiatesi utterly destroyed San Ginesio in 1248. Under Frederick, the walls of the castle were expanded and regularized (1217-1221) and the great tower keep was built to his specifications (1229— 1240). In the sixteenth century, the tower was more than 120 feet (37 meters) high, but it was destroyed by bombardment in 1944. In 1236, Frederick's good friend turned traitor, Pier de la Vigna, was imprisoned in the castle, where, grief-stricken, he dashed his brains out.

Tower (reconstructed) of Pier della Vigna, San Miniato. Photograph courtesy of Christopher Kleinhenz.

San Miniato developed a government typical of thirteenth-century communes, with rule by twelve councillors, and a distinct *popolo* led by a captain. From 1250 to 1280, Ghibellines dominated the fortress town; but after the battle of Benevento (1266) Guelfs were readmitted to the town. After 1280, imperial influence declined, the Guelf *popolo* became more powerful, and the town gravitated toward Guelf Florence. The upper, or magnate, class, however, remained unscathed by this popular

reaction. The town's productive economy was almost entirely based on agriculture, and the magnates controlled most of the land. Without a strong commercial or professional class, little conflict resulted from class friction. This cooperation may also account for the relatively strong local agricultural economy, which saved the populace from the impoverishment that visited much of Tuscany in the early *Trecento*.

In 1313, San Miniato, with its fortress solidly in Guelfhands, held up the advance of Emperor Henry VII against Florence. The bond continued to tighten, and in 1347 a formal alliance (to the advantage of Florence) was signed. In 1368, in retaliation against marauding Samminiatesi, Florence successfully besieged the town and ended its autonomy. Henceforth, it would formally serve as the key to Florence's western defenses.

Extant structures in San Miniato include two towers of the *rocca*, one of which serves as the bell tower for the present-day cathedral. This eleventh-century church originally carried a dedication to Mary and was enlarged in the fifteenth century. It became a cathedral when San Miniato received a bishop in 1622, and it underwent restoration in 1860. The Palazzo dei Vicari (imperial vicars), across from the cathedral, dates from the late 1100s. The enormous Franciscan church and convent complex of San Francesco were begun in 1276 but remained incomplete until 1480.

Sardinia

Sardinia is an island off the west coast of the Italian peninsula, about 145 miles (233 kilometers) from the mainland, with an area of 11,000 square miles (28,490 square kilometers). It is largely mountainous in the northern and central regions; the highest elevation—6,017 feet (1,834 meters)—is at Gennargentu. The southern region is flatter and better suited for agriculture.

The island's geographic position in the mid-Mediterranean isolated it culturally from the European mainland and made it vulnerable to attack and domination by seafaring powers. Each foreign dominator introduced its own system of government, laws, and culture; but these transformations, while they colored life in urban centers, often did not penetrate deeply into the fabric of the indigenous culture. Sardinia's economy has been based consistently on a combination of agriculture and pastoralism, with durum wheat and sheep's-milk products being the chief commodities. Its physical isolation led to the retention and preservation of local culture, especially in the interior regions; compared with mainland Italy, Sardinia has been characterized by a high degree of cultural conservatism. In the medieval period, the island briefly developed its own indigenous system of government: and laws independent of foreign influence.

Sardinia has been inhabited since Neolithic times. The earliest inhabitants, Mediterranean peoples who dug shaft tombs into the sides of cliff to bury their dead, were followed by the so-called Nuragic people, a more warlike group who left *nuraghi*, huge dry stone fortresses, as reminders of their culture throughout the island. In the Middle Ages, many of these archaeological relics became sites of Christian worship. During the pre-Roman period, the island was controlled by the Etruscans and the Carthaginians. It was ceded to Rome during the second Punic war in 238 B.C.

The Romans

In A.D. 300, Sardinia was under Roman domination. The *pax Romano*,

made the island less isolated from the mainland and endowed it with a web of roads and aqueducts. Important Roman senators were often granted *latifundia* in the fertile southern part of the island; these were a major source of wheat for the Roman empire. Herding was practiced in the mountainous northern and central regions, while the fertile plateaus of the northwest had a combination of horticulture and pastoralism. Sardinia also served as a dumping ground for *personae non gratae* in the empire; many Jews and Christians were exiled there. It was thus that Judaism and Christianity were introduced to Sardinia, and Cagliari, a southern port town, became an important seat for both religions. Cagliari maintained a flourishing Jewish community throughout the Middle Ages, and Christianity spread rapidly across the island. The Roman period may be said to have ended officially in 455, with the first invasion by Vandals; Sardinia, however, remained strongly Roman and Christian despite the raids, which affected only the coastal areas and never left a strong cultural stamp on the island.

The Byzantines

In 533, the Vandals were defeated by the Byzantines, who quickly took control of the island. The Byzantine influence on Sardinian culture, language, and religion was considerable. Greek became the official language of church and state, and the basically Latinate lexicon was modified by the introduction of numerous Greek terms and names. Byzantine Christianity also left its mark on the island; a large number of Byzantine-style churches dedicated to eastern saints and a number of festivals and customs (such as the veneration of the dead or sleeping Virgin on the feast of the Assumption, 15 August) date from this period. It was also through Byzantine influence that the Sardinian agricultural-pastoral year began on 1 September, and agricultural contracts were renewed and negotiated on this day.

Under the political domination of the Byzantine empire, Sardinia was classified as part of the territory of Africa. There were two distinct administrative representatives of the empire: the *praeses* or *judex provincial*, whose seat was in Cagliari; and the *dux*, a military leader, based in Forum Traiani (modern Fodron-gianus). During the pontificate

of Gregory the Great (590-604), the Christianization of the inhabitants of the innermost mountainous areas of Sardinia, the so-called *Barbagia*, took place. This area had never been dominated by the Romans, and its inhabitants had remained pagan and intolerant of outside domination.

At this time, Sardinian society was divided into two major classes: the *liberi* or freemen and the serfs. Serfs were treated as property and had few legal rights. In practice, however, the lives of serfs and freemen were not dissimilar, especially in rural areas, where the two classes labored side by side in the fields. Urban centers were characterized by a more stratified society.

In 771, the first of a number of Arab attacks on Sardinia occurred. On the whole, the Arabs did not succeed in dominating Sardinia, and Arab influence on the culture was negligible. However, as a result of the Arab incursions many coastal cities were destroyed and population began to shift from the coastal areas to the interior. Trade decreased, and the economy shifted to a subsistence base as each town or village attempted to achieve economic self-sufficiency. After the Arab conquest of Sicily in 827, contacts with Constantinople became more difficult to maintain. Sardinia became effectively isolated from Byzantium and had to fend for itself.

The *Giudicati*

Between 827 and 1000, Sardinia evolved its own system of government for the first time since prehistory. The islanders organized themselves into four *giudicati* (Sardinian *rennu* or *logu*), or political units, which operated essentially on a feudal system. These were the *giudicati* of Cagliari in the south, Gallura in the northeast, Arborea in the central regions, and Torres in the northwest. Each *giudicato* was headed by a *judike* who owned vast tracts of land. A peasant economy prevailed in small villages and towns. The lot of the freemen and serfs improved under the *giudicati*. While they could still be bought and sold, serfs were no longer considered chattel (*res*) and had the right to work four days a week on their own plots. They could also contract marriages, give legal testimony, and have a surname.

During this time, the church was also powerful and held a great deal

of land. There was a flourishing monastic culture, and Sardinian monasteries were centers of learning in the Mediterranean. The growth of the cult of the Virgin and the proliferation of country shrines dedicated to her date from this period. However, Arab raids continued to be a threat, especially in the south, and the four *giudicati* enlisted the aid of the maritime republics of Pisa and Genoa to help defeat them.

Pisa and Genoa

The two city-states of Pisa and Genoa were not content to limit their interference to military aid but began a struggle to dominate the island in order to exploit its resources. In the twelfth century, the Pisans and Genoese had already been granted an exemption from the payment of commercial tribute to the *jud-ib.es*. In 1258, the *giv.dicato* of Cagliari fell to Pisa, and the Vi-sconti family began its long rule in the south. Not to be outdone, the Doria family seized control of Logudoro, an area in the *giudicato* of Torres.

The colonization by the maritime republics was at first beneficial to Sardinia. It stimulated commerce, introduced new wealth and economic goods, and led to the development of a middle class in urban centers. There was an influx of highly skilled artisans from the continent, and a flourishing of architecture in the Pisan Romanesque style: the churches of Santissima I rinita di Saccargia, San Gavino di Porto Torres, Santa Maria di Ardara, and San Pietro di Sorres all date from this period. Besides durum wheat and products made of sheep's milk, Sardinia exported salt, barley, and silver to the continent. Its thick forests were felled to build ships for the navies of the maritime republics, and the island was a major source of slaves for the republic of Genoa in the thirteenth century. Pisan and Genoese laws were also introduced, though these affected mostly the wealthier segments of society. As always, in the interior regions and among the common people, traditional patterns of land use, inheritance, and justice prevailed.

Aragon

Pisa and Genoa continued their struggles, however, sapping vitality from the renewed economy and threatening the stability of the church and its monastic culture. In 1297, Pope Boniface VIII ceded Sardinia to James II of Aragon, in the hope that James would subdue the constant strife and bring peace to the island once again. The Aragonese did not become dominant instantly; not until 1323 did they take firm control of the island and set up their governmental center in Sassari, a city-state in the northwest previously allied with Genoa. Land grants were given to Aragonese nobles, and a system of absentee governance was instituted. Sardinia, though a part of the kingdom of Aragon, had no representation in the Aragonese parliament, and Sardinians were excluded from the governance of their homeland as posts were given over to Aragonese nobles. Furious, the city-state of Sassari attempted a rebellion with the help of the Genoese, but it was unsuccessful. In 1410, Arborea, the last independent *giudicato*, fell to the Aragonese.

Sardinian Language

The development of spoken Latin in Sardinia, as elsewhere, led to a network of local dialects. Though there has never been a true standard for the entire island, the speech of the isolated Logudoro in north-central Sardinia has often served as the basis for writings intended as pan-Sardinian, and it is still considered by many inhabitants to be Sardinian *par excellence*. Logudorese and other dialects (e.g., Gallurese in the far north and Campi-danese in the southwest) are considerably different from any to be found on the Italian peninsula or in Sicily, although northern Gallurese closely resembles the speech of neighboring southern Corsica, reflecting the expected dialect continuum.

Among the most striking phonological characteristics of Sardinian is maintenance of fully occlusive [k] in the center of the island, before vowels which in other Romance languages have resulted in various degrees of palatalization or assibilation. For example, *pace* results in [pake] "peace," and *centu* results in [kentu] "one hundred." (Remnants of this phenomenon are also evident in Vegliote, which was once spoken in coastal Dalmatia.) Another characteristic is that definite articles were derived from *ipse* and its variants rather than from *illu* (this trait is also found in Balearic Catalan). For example, *ipsu* produces *su*, and is equivalent to Italian *il* and *lo*, which come from *illu*. One unique development is the preservation of neuters with final -s (*tempus* remains *tempus*, "time"). Another is the maintenance of distinctions between stressed ĭ and ē on the one hand and ĭ and ō on the other. For example, *pĭra* produces *pĭra*, "pear"; *tēla* produces *tela*, "cloth"; *crŭce* produces *cruke*, "cross"; and *sŏle* produces *sole*, "sun."

With regard to lexicon, there is much archaism. For example, "house" is not *casa* but *domo* (from *domus*); and "white" is not a reflex of *blancu* but is *albu* (from *albu*). Also, "to speak" is *narrere* (from *narrare*) rather than deriving from *parabolare* (Italian *parlare*, French *parler*) or from *fabulare* (Spanish *hablar*, Portuguese *falar*). Forms of the future remain analytical: Logudorese *amos afage* ("we shall do," literally, "we have to do") is a transparent reflex of *habemus ad facere*, in contrast to the typical Romance synthesis (e.g., Italian *faremo*, which comes from *facere habemus*). Owing to these and numerous other distinguishing features, most speech types on the island give the overall impression of great linguistic conservatism, a trait first noted—if disdained—by Dante

in *De vulmri eloquentia*.

In Sardinia, the vernacular was used as the normal medium of official documents rather earlier than on the Italian mainland or elsewhere in Romance Europe, and much more extensively. The exact reason for this is unknown, but it is often assumed to reflect less schooling in Latin. The first known text in Sardinian is *Privilegio logudorese*, also called *Carta consolare pisana*, a declaration by a judge exempting Pisan merchants from a levy, datable from 1080–1085. Far more numerous, and generally much less tainted with spurious Latinisms, are the *condaghes*, official documents recording various legal transactions of the eleventh through fourteenth centuries. In all these, regardless of provenance, the language used is very clearly a fully developed vernacular, and although local features can usually be identified, it appears that the target language was essentially Central Logu-dorese. One line from the *Condaghe di San Nicola di Trullas* (1113) illustrates typical language. A certain Martinus reports gifts and acquisitions: *Ego Martinus p[re]s[b]ite[r] et priore de s[an]c[t]u Nicholas de trullas ci ponio in istu codice su cantu 'nce parai et in donu et in prezu* ("I, Martinus, priest and prior of Saint Nicholae de Trullas, put here in this codex what I procured as gift or in purchase"). The wealth of such texts and their relative faithfulness to actual usage combine to make Sardinian, especially Logudorese, the most richly documented of early medieval Romance tongues.

Scholasticism

Scholasticism can be defined as a philosophy or theology that stresses rational justification of religious beliefs and a systematic organization of those beliefs. It was a highly detailed method of organizing theology that would eventually shape intellectual inquiry during the period 1200-1500. Although the formative phase of scholasticism was in the ninth through twelfth centuries, the sixth-century scholar Boethius is regarded as one of its founders because he was the first to proclaim that reason had to be joined to faith—a main tenet of this philosophical system. In addition, Boethius translated a number of the works of Aristotle, and his translations, along with his own writings, created for medieval scholars a Latin vocabulary of logical terms. In the ninth century, the scholar John Scotus Eriugena translated the works of Pseudo-Dionysus into Latin and used these ideas to compose his own work, *On the Division of Nature* (*De divisione naturae*). This was one of the first works to use philosophy to understand and interpret the universe in light of the Christian faith.

In the late eleventh century, the University of Paris reemerged, after the so-called dark ages, and became an intellectual center; thereafter, more theological schools developed. Theologians such as Saint Anselm and Abelard began to explore further the idea that reason can explain the mysteries of Christian faith. In particular, Abelard's emphasis on using logic, instead of relying solely on the authority of the church fathers, brought logical reasoning to the forefront of the scholastic movement.

As theologians felt a need to systematize the ideas of Saint Augustine

and to demonstrate the rationality of Christian theology, they turned to Aristotle to find a philosophical method that would allow them to achieve their goals. The rediscovery of Aristotle in the late twelfth century and the early thirteenth century led to writers such as Thomas Aquinas to apply Aristotelian presuppositions to order and correlate the ideas of Christian theology. Similarly, these writers used Aristotelian ideas to illustrate the rationality of Christian faith. Thus scholastics used philosophy to establish the intrinsic rationality of Christian theology; and in order to clarify the complete harmony of that theology, they closely examined how its various aspects were interrelated.

In the early medieval period, two major schools of philosophy—Thomism and Scotism—originated from the works of Thomas Aquinas and Duns Scotus, respectively. Aquinas's *Summa theologiae* became the accepted textbook on theology, and the Thomist position eventually superseded Scotism.

The humanists of a later period regarded scholasticism as no more than fruitless pedantic speculation over technicalities. Today, scholars recognize its impact on the Reformation and the works of Martin Luther and John Calvin. In any case, though, by the end of the fifteenth century scholasticism as an intellectual movement was waning, primarily because its development had been linked to specific religious orders.

Scrovegni Family

From the modest origins of their supposed founder—Rinaldo Pota di Scrova, a street musician turned moneylender—the Scrovegni eventually became one of the most powerful families in Padua during the late medieval period. By 1081, they were counted among the nobles, and later, in the years of the Carrarese domination of the city (1318-1405), members of the Scrovegni family were often close associates of the Paduan *signori*. Eventually, in 1390, the Scrovegni were exiled; but they were repatriated after Padua came under Venetian control in the early fifteenth century. The Scrovegni remained in Padua until at least 1444, when they moved to France.

The most noteworthy members of the family were Reginaldo di Ugolino (d. 1288 or 1289), his son Enrico (d. 1336), and Enrico's granddaughter Maddalena (c. 1356–1429). True to family tradition, Reginaldo amassed a fortune through lending money at interest to powerful figures such as Gerardo da Camino, the captain general of Treviso. Reginaldo's usury was so notorious that Dante identified him as the archusurer in *Inferno* 17 (verses 43-78). Looking around the seventh circle of hell, where the usurers are found, Dante is able to identify the sinful souls only by the heraldic devices on their money bags. Reginaldo—whose bag is decorated with an image of a blue pregnant sow, in reference to the family's coat of arms—is the only one among the usurers who addresses Dante. The wealth amassed by

Reginaldo allowed his son Enrico to purchase, in 1300, a sizable plot of land in Padua that had once been the site of a Roman arena. There Enrico constructed an imposing family palace and an adjoining chapel with frescoes by Giotto and statuary by Giovanni Pisano. Enrico's wealth and power passed to his eldest son, Ugolino, and in turn to Ugolino's sons Giacomo and Enrico. Maddalena, the sister of Giacomo and Enrico, was a distinguished writer and humanitarian, and a spokesperson for the Scrovegni. Of her writings, there survives only *Lettera gratulatoria* (1388), which she wrote to Iacopo dal Vermì while he was liberating Padua from Carrarese control. Two years later, Maddalena was exiled to Venice with her father and her brothers. There she founded a hospice for the poor in Campo Santa Margherita.

Scrovegni Family Chapel

The Scrovegni Chapel in Padua is best-known for its frescoes by the Florentine painter Giotto. In 1300, Enrico Scrovegni purchased land from the Dalesmanini family on which he built a palace and an adjoining chapel. Since the property had once been the site of a Roman arena, the chapel that Scrovegni built is also known as the Arena Chapel. Although the palace was demolished in the nineteenth century, the chapel remains intact.

The chapel is dedicated to both the Virgin of the Annunciation and the Virgin of Charity and was consecrated on 25 March 1305, the feast of the Annunciation. By this date, Giotto had probably finished his frescoes on the interior of the chapel. He may even have been the architect of the chapel, since the simplicity of its interior and the six large windows (an extraordinary feature) along one wall make it an ideal context for fresco painting.

Giotto di Bondone (1266-1336), Scrovegni Chapel, Padua. View of the interior, looking toward the altar. Photo: © Scala/Art Resource, N.Y.

Art historians have traditionally suggested that Giotto's cycle begins with the scene of the expulsion of Joachim from the temple and concludes with a monumental representation of the Last Judgment on the entrance wall. However, the cycle may actually begin over the chancel arch, where God the father, in addition to dispatching the angel Gabriel to the Virgin, may be dispatching another angel to initiate the narrative in the chapel. From this point the narrative moves to the south wall, and from there the cycle advances around the chapel walls from left to right and top to bottom in three narrative bands. In the top band are scenes from the lives of the Virgin's parents and the early life and marriage of the Virgin herself. With God's dispatch of Gabriel and the Annunciation on the arch between the nave and the chancel,

Christ's infancy, ministry, and passion, and the events following the passion, are told in the scenes of the middle and lower bands. At the base of the side walls are frescoes representing the seven virtues and seven vices. In the barrel-vault ceiling are roundels representing Christ and the Virgin and Child that are each surrounded by four smaller roundels representing various prophets. Within the chancel are a Madonna and Child and two angels by Giovanni Pisano and frescoes by late fourteenth-century imitators of Giotto. Giotto's own frescoes are notable for visual clarity and expressive force, achieved through a remarkable economy of means. The narrative progresses regularly from one scene to another around each of the three bands, but formal and iconographic connections are also evident between scenes painted in different bands; smaller scenes in the painted borders between frescoes provide Old Testament parallels and other commentary on the main narrative. Throughout the chapel the narrative is highly selective, and in addition to the Gospels, it seems that apocryphal writings and popular stories were consulted; a probable source was Jacobus da Voragine's *Golden Legend* of the mid-thirteenth century.

Enrico Scrovegni declared that he built the chapel "in honor of the Virgin, of the city of Padua, and for the salvation of his soul and those of his family past and present." Despite this claim, historians believe that Enrico probably endowed the chapel as expiation for his family's sin of usury; this hypothesis is supported by prominent references in the fresco program to money and its illicit use. Ultimate redemption for the Scrovegni is suggested in the Last Judgment, where Enrico presents a model of his chapel to the Virgin of Charity.

Scuola Poetica Siciliana

The *scuola poetica siciliana*—the Sicilian school of poetry—is a literary movement that originated at the court of Frederick II in Palermo, the *magna curia*. This school gave rise to an extensive poetic production in the vernacular, drawing its inspiration from the courtly love poetry of the Provençal troubadours. The term *scuola poetica siciliana* designates the poetic works that are placed first in the most extensive collection of the earliest Italian poetry, the Vatican Codex Lat. 3793, known as *Libro de varie romanze volgari*. The concept of a Sicilian school is based on a passage from *De vulgari eloquentia* (1.12.2) in which Dante declares that all poetry composed in Italy by his predecessors is called Sicilian. Dante's chief argument is political-cultural: the poetry is called Sicilian because Sicily was the *regale solium*, the seat of royal authority; and the *magna curia* provided the cultural climate in which poetry in the vernacular could flourish. For reasons that will become obvious later, Dante does not draw his conclusions from the nature of the language serving as medium for the first national poetry in Italy. Many of the poets of the *magna curia* were Sicilian, but several were natives of the continental south, and Percivalle Doria came from Genoa, in the north.

It was not their geographical extraction that bound these poets together; what they shared was the poetic medium and the

intellectually and artistically stimulating atmosphere prevailing at Frederick's court. Many of them were dignitaries at the *magna curia*: notaries, secretaries, falconers, knights. Even the emperor himself and his chancellor, Pier de la Vigna, wrote poetry. The Sicilian school is generally assumed to have flourished c. 1230 to 1250, the year of the emperor's death, but we have no proof that the members of the group fall into two separate generations. On the contrary, scholars are now inclined to think that the poetic activity at Frederick's court was short-lived, and that it was most intense during the 1230s, a period coinciding with Giacomo da Lentini's documented involvement in notarial duties at the court. Granted, the problematic figure of Re Giovanni, supposedly the emperor's father-in-law, does not fit easily into this condensed chronology; but this fact, combined with the fact that his poetry is not particularly archaic, lends some credence to Monteverdi's hypothesis (1954) that Re Giovanni is not identical with the historical figure but was simply a "crowned" minstrel.

The emperor may have provided the original incentive for creating a poetry in the Provençal mode at his court, but the true founder of the poetic movement was a notary there, Giacomo da Lentini. Giacomo is mentioned in documents from 1233 to 1240. The Bonagiunta episode in Dante's *Purgatorio* (24.55-57) confirms Giacomo's pioneering role, and the prestige he enjoyed may further be inferred from the prominent place his poems occupy in the codices, where they are listed first at the beginning of each genre division. Even though the poetry of the troubadours was admired and imitated with fervor throughout Italy, we have no proof that the troubadours ever ventured as far south as Sicily. Many theories have been formulated to account for the contact between the Sicilians and their Provençal mentors. One hypothesis—though it is now of only historical interest—was that direct contacts had come about in Bologna, where Frederick's notaries had studied law. In any case, although northern poets (such as Sordello, Lanfranc Cigala, and Bonifaci Calvo) were able to use Provençal as their medium, the dialects of the south were too different to allow for any such total linguistic penetration. Thus the poets of the *magna curia* soon realized that to make themselves understood in Sicily they would have to create a poetic language, based on Italian dialects. The emperor himself may have been instrumental in the decision to discard Provençal and replace

it with an Italian dialect, but there is a strong likelihood that this significant development was initiated by Giacomo da Lentini.

Much ink has been spilled in attempts to define the linguistic base of the Sicilian school, and the final identification of the underlying dialect as Sicilian has been reached laboriously through modern philological science. The language of the *canzo-nieri* is hybrid and composite, and during the early twentieth century scholars were still convinced that it was not Sicilian. Today, its underlying *sicilianità* is no longer disputed, although the exact geographical provenance of the dialect that forms its base remains unresolved. The difficulty arises because we are dealing not with a humble spoken dialect that can easily be traced, but with a refined literary Sicilian, called *illustre* or *aulico* or *curiale*. Some scholars theorize that each poet may have used his own dialect as a base; but since no individual linguistic characteristics have survived, it seems likelier that the poetic medium was made up of elements from the most important dialects, with infiltrations from the major cultural languages of the time: Latin, Provencal, and French.

The whole issue is further complicated because the Sicilian texts have not reached us in their primitive form; rather, they are transmitted in manuscripts that were put together on the mainland by scribes who were unfamiliar with the Sicilian medium. Since most scribes were from Tuscany, the original version underwent Tuscanization; by contrast, the presence of certain southern, non-Sicilian features is attributable to scribes from the south. Rhymes have provided powerful support for the idea that the poetic language is of Sicilian extraction. Since rhyme words resist modifications, they were subjected to close scrutiny by scholars, who discovered that many seemingly imperfect rhymes would become regular simply by restoring the rhyme words to their primitive Sicilian form. The so-called Sicilian rhymes are those which allow for the rhyming of close *e* with *i* and of close *o* with *u*, as in *savete-tradite* and *ora-pintura*. Standard Italian maintains these vocalic differences; but in Sicilian dialects the close *e* merges with *i* and the close *o* with *u*, so that the underlying Sicilian forms of these rhyme words would be *savite* and *ura*. Additional proof comes from an unexpected source: a mysterious manuscript owned by the sixteenth-century humanist Gian Maria Barbieri. The Barbieri manuscript, which was published in 1790 by Gerolamo Tiraboschi, contains the primitive

Sicilian version of a *canzone* by Stefano Protonotaro, *Pir meu cori alligrari*, along with a few fragments of other texts. Protonotaro's *canzone* is the only poem to have survived in both a Sicilian and a Tuscanized version. The Barbieri texts provide a concrete image of the primitive medium and have played a decisive part in settling the language issue. Editors usually restore only those Sicilianisms that can be recovered from the codices, but some also resolve the Sicilian rhymes. An extreme method is total Sicilianization in the light of the Barbieri text.

The Provençal troubadours are noted for cultivating a variety of themes—amorous, moralizing, political, religious, etc. Their Sicilian disciples, however, find inspiration almost exclusively in the theme of courtly love and make only very timid digressions from it. Giacomo da Lentini (the Notaro) writes a poem on friendship, Rinaldo d'Aquino praises prudent speech, and Re Enzo reflects on the changeability of human destiny; but such topics are not common. Love in the troubadour mode is conceived as a feudal service, an amorous vassalage in which the poet-lover serves his lady as a vassal would serve a suzerain. The lover is obedient and submissive, while the lady is haughty and arrogant. Torn between hope and despair, the lover must gain merit in order to earn his lady's pity or compassion. Along with the concept of courtly love, the Sicilians also borrowed its trappings. Provençal lexical items were adopted, stock phrases and images were appropriated, many troubadour poems were closely imitated, and a few troubadour poems were even translated. The complex terminology devised by the troubadours to express stages in the lover's progress toward his final acceptance by the lady underwent a simplification in Sicily, but without any basic conceptual or structural changes. The poetry of the Sicilian school contains no references to contemporary historical events or to domestic episodes at Frederick's court. This enhances its abstract quality, which is already inherent in the theme of courtly love. Even the lady, though always present, remains an abstraction; and the poems are stylized in both form and content, so that they have a certain static character. They contain no lyrical development and have no biographical value. To the Sicilian poets, poetry offered an escape from reality and routine; they had created a closed, poetic universe, characterized by great thematic unity and formal elegance, and they never had to write for gain— whereas the

troubadours were often entertainers as well as poets. The Sicilian poet is defined by Folena (1965) as a *colto dilettante di poesia*—a refined, educated amateur of poetry.

The poetic genres of the Sicilian school are mostly inherited from the troubadours. The most prestigious genre is the *canzone*, imitated from the Provençal *canso*. The *canzonetta* does not appear to be formally different from the *canzone*, except that it often includes dialogue and so takes on a more popular tone. The *tenzone*, derived from the Provençal *tenso*, had limited appeal in Sicily, since the only subject matter discussed in these poetic exchanges is the nature of love. The most significant metrical innovation of the Sicilians is the sonnet, which was first used by, and is traditionally credited to, the founder of the school. Like the *canzone*, the sonnet deals with amorous themes, but often in a more scholastic or philosophical vein. The Sicilians imitate most of the complex stanza structures and rhyme schemes of the troubadours.

Seneca

Lucius Annaeus Seneca (c. 4 B.C.-A.D. 65) was born to a wealthy equestrian family in Cordoba (Spain), was educated in rhetoric and Stoic philosophy in Rome, and entered political life at age thirty-one. He was the young Nero's tutor, and when his pupil ascended to the throne in A.D. 54, Seneca helped guide the imperial government. For eight years, with Seneca's participation, Nero's empire enjoyed a period of good government; but as Nero's hunger for power grew, Seneca found his position compromised and withdrew from the court to devote himself to writing. In 65, Seneca was implicated in the Pisonian conspiracy (although his actual involvement is not known) and was condemned to death. Like his nephew Lucan, Seneca took his own life that same year.

Seneca's writings consist of philosophical, scientific, and dramatic works, some of which are now either entirely or partially lost. His philosophical works, in prose, include the following: *Dialogues*, twelve books of treatises on ethical and psychological issues; *De beneficiis*, which examines the nature and modes of beneficence; *De dementia*, a suggestion for an ideal political policy based on moderation and clemency, directed at Nero; and *Epistulae morales ad Lucilium*, a collection of letters about spiritual growth, addressed to a younger friend, Lucilius. The *Epistulae* mark a generic innovation on Seneca's part; using occasional events as points of departure for the articulation

of central tenets of Stoic philosophy, the letters encourage Lucilius to concentrate on inner freedom, self-reliance, and indifference to temporal vagaries. The seven books of *Naturales quaestiones*, treating natural phenomena, comprise Seneca's scientific output. His dramatic interests are represented by nine tragedies treating Greek mythological subjects: *Hercules Furens*, *Troades*, *Phoenissae*, *Medea*, *Phaedra*, *Oedipus*, *Agamemnon*, *Thyestes*, and *Hercules Oetaeus*. In addition, Seneca is the author of *Apocolocyntosis* (also known as *Ludus de morte Claudii*), a Menippean satire on the deification of the emperor Claudius. Of doubtful attribution is Seneca's correspondence with Saint Paul, mentioned by Jerome.

The spurious correspondence between Seneca and Paul, which frequently accompanied manuscripts of Seneca's *Epistulae*, helped to enhance Seneca's reputation during the Middle Ages. Although a pagan, he was considered admirably ethical, and his prose works became increasingly popular throughout the Middle Ages. *De beneficiis* and *De clementia* were particularly well-liked during the twelfth and thirteenth centuries, and Seneca's philosophical work was frequently read in medieval schools. The *Dialogues*, a work that was less well known, evidently reappeared at the end of the eleventh century, but the *Apocolocyntosis* remained rare and unpopular. Copies of the *Naturales quaestiones*, like Seneca's tragedies, were not widely known or disseminated; but in the early fourteenth century his dramatic works gained favor, especially in Padua among the protohumanists and at the papal court at Avignon, and they soon contributed to Seneca's reputation in the late medieval period.

The Suicide of Seneca. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 105r.

Dante's knowledge of Seneca was slight and was probably confined to the philosophical works. In Limbo, Seneca is identified as *Seneca morale* ("Seneca the moralist," *Inferno*, 4.141). Albertino Mussato, however, focused on Seneca's dramatic works; Albertino's successful play *Ecerinis* is clearly modeled on Senecan tragedy. Petrarch was influenced by all of Seneca's known corpus. His numerous letters owe much to Seneca's epistolary form, and he seems to admire Seneca's moral philosophy, claiming, in his *De sui ipsius et multorum aliorum ignorantia*, that authors such as Seneca have made him morally better. Petrarch's public literary persona, revealed in his letters and essays, owes a debt of gratitude to Seneca's Stoic character.

Translations of Seneca have been published by the Loeb Classical Library (11 volumes).

Sennuccio Del Bene

The Florentine poet Sennuccio del Bene (c. 1275-1349) was chamberlain of the commune in 1297. Like Dante, Sennuccio was a White Guelf who supported the siege of Florence in 1312 by the Emperor Henry VII of Luxembourg; he was exiled from Florence in 1313. After finding refuge with Franceschino Mala-spina in Ravenna, Sennuccio went to Avignon (c. 1316), where he worked as a secretary and papal envoy to Germany. In Avignon, Sennuccio became close friends with Cardinal Giovanni Colonna and with Petrarch (Francesco Petrarca). In 1326, Sennuccio was granted a conditional amnesty by the Florentine government, thanks to the intercession of Pope John XXII and the papal legate in Tuscany, Giovanni di San Teodoro. In 1346, Sennuccio became director of a hospital, San Bartolomeo del Mugnone, which had been founded by his father in 1295. As Petrarch's gloss in the draft manuscript of the

Canzoniere (Codex Vatican Lat. 3196) indicates, Sennuccio died on 28 November 1349.

Petrarch speaks of his friendship with Sennuccio in several poems in the *Canzoniere* (108, 112, 113, 144) and in a letter (*Familiare*, 4.4). Both poets delighted in reading and commenting on the classics, and they often spoke of love. Recalling Ovid's definition of true friendship, Petrarch writes in sonnet 113 that Sennuccio is the other half of his soul, and he mourns Sennuccio's death in one of the most melancholic lyrics in the *Canzoniere*, *Sennuccio mio, ben che doglioso et solo* (287). Petrarch also wrote poems to and about Sennuccio that were included not in this songbook but in the *Trionfo d'amore* (4.37), placing him among illustrious Greek, Latin, and Italian poets. Sennuccio responded to Petrarch's sonnets *Siccome il padre delfolle Fetonte* and *Signor mio caro, ogni pensier mi tira* with two of his own: *La bella aurora nel mio orizzonte* and *Oltra l'usato modo si rigira*.

Fourteen of Sennuccio's poems are extant: eight sonnets, three *canzoni*, two *ballate*, and one *lauda*. In these, Sennuccio deals with religion, ethics, politics, and love. Some critics (e.g., Cuomo 1926) consider him a late imitator of the *dolce stil nuovo*. However, Corsi (1969, 114) argues that although there are *stil-novo* elements in what seem to be the youthful poems, Sennuccio has a voice and art of his own. The sonnet *Era nell'ora che la dolce Stella* is reminiscent of Dante's poem for Lisetta (*Rime*, 117), but it differs from Dante's sonnet in that the protagonist is the tormented poet, not the ineffable mistress. Corsi describes Sennuccio as a poet of "oscillating and suspended states of mind" (114) whose affinities are more with Petrarch than with Dante. Actually, Sennuccio's life experiences were similar to those of Dante as well as Petrarch; as noted above, Sennuccio, like Dante, was an exile and an ardent supporter of Henry VII.

It is important to understand Sennuccio's poetic voice in light of the medieval aesthetic of imitation. In the *canzone* *Da pot ch'V ho perduta ogni speranza*, Sennuccio voices his public and private emotions. With the death of Henry VII and the defeat of his political aspirations, Sennuccio is unable to return to Florence or—equally important—to his lover. The eulogy for the emperor (stanzas 2-4) is motivated and framed (stanzas 1 and 5) by the poet's personal stake in Henry's destiny. Sennuccio artfully weaves the various strands of public and private love

(for universal political order, for the figure of Henry, for his native city, and finally for his lover) into an intricate tapestry. The resulting image is that of a poet who expresses his despair in order to affirm the guiding principles of his life. Love is a dominating theme and a motivating force for Sennuccio.

Sercambi, Giovanni

Giovanni Sercambi (1348-27 May 1424) was born in Lucca, where his

father ran a book and paper store; he thus grew up with a good library at hand. He was educated by private tutors for a government career, and he prospered by supporting the rise to power of the Guinigi family. After 1400, however, feeling neglected by the Guinigi, he withdrew from politics and began to write. Sercambi's works include *A Chronicle of the Affairs of Lucca* (from 1164-1424, including events in which he had participated); the *Monito*, a compendium of advice on finance and administration based on his own experiences in public service; and, in his final years, the *Novelle*, a collection of 155 tales.

The book of advice, dedicated to the Guinigi, advocates practical measures for maintaining control: taking a census of the citizens, forbidding them to possess arms, and ensuring that the legislative council is filled with one's own friends and relatives. The novelle, which draw in part on Sercambi's history of Lucca, are similarly hard-boiled; the collection is filled with tales of deceit, fraud, theft, clerical misbehavior, and the self-serving manipulations of lovers, parents, children, dealers, and clients. A few of the tales are about Sercambi himself, e.g., how he escaped an attack by highway robbers.

The tales are framed by an account of a plague in 1374, during which a group of men and women travel around Italy to avoid the disease. As on some of the actual penitential pilgrimages occasioned by recurring plagues, the travelers agree to pool their money, hear mass every morning, and refrain from sexual activity during the journey. Boccaccio's influence is clear in the setting (the plague), in the inclusion of occasional poems, and in more than twenty of the tales; but instead of having various members of the group narrate in turn, Sercambi's travelers appoint one storyteller to keep them entertained. This character often tells stories appropriate to the places they are visiting: stories of theft near Naples, of Roman history at Rome, of Venetian customs at Venice. Many of the stories are drawn from contemporary or recent events, as well as from Roman myth and history, popular fabliaux, and other medieval collections of tales, such as the *Disciplina clericalis* and the *Decameron*. The titles of the stories suggest the moral categories of preachers' *exempla*-. "On Great Prudence," "On Supreme Avarice," "On Supreme Justice," "On Vain Lust," and so forth.

Sercambi's style is rough, and his tales were rarely mentioned before the late 1700s, when one of the two fifteenth-century manuscripts was

found. However, since its first printing in Venice in 1816, the *Novelle* has been reprinted many times.

Serdini, Simone

The court poet Simone Serdini (c. 1360-c. 1419 or 1420), nicknamed *Il saviozzo* ("the sage fool"), was born in Siena. He had a riotous and impulsive nature and was banished from Siena in 1389 for not having paid a fine for fighting with two fellow citizens. Thereafter, except for a brief sojourn in Siena in 1400-1402, he wandered from court to court. In 1396, he was in the service of Roberto Novello of Poppi, in the Casentino region of Tuscany; in 1402, he joined the court of Pandolfo III Ma-latesta, who ruled Bologna for the Milanese lord, Gian Galeazzo

Visconti. In 1405, Serdini was in Perugia; in 1408, he was at the court of King Ladislao in Naples, where he eventually became the secretary of Tartaglia di Lavello, a commander in the king's army. He was in Toscanella (modern-day Tuscany) in 1419 when it was occupied by Tartaglia. There, Serdini was imprisoned for reasons that are now unknown. He committed suicide while in prison, in either 1419 or 1420.

Serdini's substantial production of 108 *rime* consists of *canzoni*, *capitoli* (poems in *terza rima*), *sirventes*, sonnets, and *madri gals*, dealing with the usual themes of love, ethics, religion, politics, and fortune. Serdini was admitted to prestigious political and social circles because of his considerable poetic talent, which he used to ingratiate himself with his patrons. Among the most notable of his laudatory poems are the *canzoni Novella monarchia, iusto signore* (for the duke of Milan), *Vittorioso Cesar nuovo Augusto* (for the king of Naples), and *Sacro e leggiadro fiume* (for the mistress of Giovanni Colonna); and the sonnet *Qual possa sempiterna, qual destina* (for Queen Giovanna II of Naples).

The mercenary nature of Serdini's output has led some critics to dismiss him as an erudite rhymester lacking the vigor and passion of other court poets, such as Fazio degli Uberti. Yet in many of his autobiographical poems, Serdini is an accomplished artist and a linguistic and stylistic experimenter. In the apocalyptic poems *Le 'nfastidite labbra in ch 'io già pose* and *Corpi celesti e tutte l'altre stelle*, Serdini mixes references to classical myth with vulgar expressions. By combining erudition and blasphemy, he creates a self-portrait of hyperbolic proportions. At the same time, however, there is an eloquence to his hyperbole which *indicates* that the bitterness he expresses is authentic. The invectives of the comic-realistic poets of the *Duecento* and *Trecento* pale in comparison with Serdini's condemnation of life.

Serdini also wrote penitential psalms and other moralizing poems. One of the most popular works was the 705-line *Storia di una fanciulla tradita*. In this poem, as in Boccaccio's *Elegia di Madonna Fiammetta*, the female protagonist recounts her betrayal by a nobleman. The *Storia di una fanciulla tradita* was widely read and imitated during the *Quattrocento*. It was even translated into Latin (Saxby 1992, 111 – 112); at that time, only Boccaccio's tale of Griselda (translated by Petrarch)

had hitherto been worthy of such a distinction.

Ser Giovanni Fiorentino

See Pecorone, II

Sergius iv, Duke of Naples

Sergius IV (died c. 1037), as duke of Naples, was nominally a vassal of the Byzantine emperor, and as such he maintained the relative independence of the city. This independence was constantly threatened by neighboring princes but was never seriously challenged as long as the Byzantine empire maintained its presence in southern Italy. However, when Emperor Basil II died in 1025 and the catapan (governor) Boioannes was called back to Constantinople by Basil's successor, Constantine VIII (r. 1025-1028), a vacuum was created which allowed the petty Lombard principalities to assert their claim for dominance in the region. During the winter of 1027-1028, Pandulf IV of Capua attacked Naples and succeeded in taking the city. Sergius was forced to flee. The cities of Amalfi and Gaeta were also threatened by this situation.

The key to the resolution of the crisis came from Rainulf and his band of Normans, who agreed to assist Sergius in regaining his city. By 1029, Sergius was back in Naples, and Pandulf, defeated, was back in Capua. In gratitude, Sergius granted to Rainulf the city of Aversa (1029) and in so doing provided the formal basis for the Normans' future involvement in the politics of the area. At this time also, Rainulf married Sergius's sister, the widow of the duke of Gaeta. When she died in 1034, Pandulf offered to Rainulf the hand of his niece, whose father had been the duke of Amalfi. Their marriage sealed the alliance that was then formed between Rainulf and Pandulf against Sergius. This about-face brought the ruin of Sergius, who left Naples in 1037, entered a monastery, and died soon afterward.

Servius

Marius Servius Honoratus (fourth century) was one of the most important textual critics of late antiquity and is known primarily for his detailed commentary on Virgil. Although Servius appears as a character in Macrobius's *Saturnalia*, little is known about his life. He was probably born in the late 360s or early 370s. He held the prestigious title of *grammaticus urbis Romae* and was lecturing in Rome by 390.

Servius's commentary on Virgil, intended for use in schools, provides notes on grammar, rhetoric, orthography, religion, mythology, and meter. Two versions of this commentary are extant: a vulgate edition, which was probably written by Servius; and another, fuller commentary, by an unknown compiler, from either the seventh or the eighth century. The later version incorporates the work of other scholars, including what is now generally accepted as part of a commentary on Virgil by the grammarian Aelius Donatus (mid-fourth century), which Servius had not previously included. This version is known as *Servius Auctus* or as *Servius Danielis*, after its discoverer, P. Daniels, who published an edition of it in 1600.

Servius's other surviving works include *De centrum metris*,

Befinalibus, De metris Horatii, and a commentary on Donatus's *Ars grammatica*.

Sette, Guido

Guido Sette (c. 1304–1368) was a lifelong friend of Petrarch, whom he met when Petrarch's family arrived in Avignon in 1312. Guido was probably born in 1304, the same year as Petrarch, and the Sette family moved to Provence from the Lunigiana at about the same time as *ser* Petracco (Petrarch's father) did. The two boys were educated together in Carpentras by Convevole da Prato; in 1316, they moved together to Montpellier to continue their studies at the law school at the university. In 1320, they transferred to the University of Bologna to follow legal studies; Guido probably took his degree in canon law there in 1327. Guido is recorded as the *vicario generale* of the bishop of Bologna in 1336, presiding over the ecclesiastical court of the diocese. Guido then

seems to have returned to the papal curia at Avignon, living there even while holding various ecclesiastical offices in Genoa. He is noted as a prelate of the cathedral in 1347, and he was appointed archdeacon in 1353. He became archbishop of Genoa on 2 July 1358, and Petrarch congratulated him in a letter, while also helpfully warning him that advancement in his career would inevitably lead to a loss of personal peace (*Familiarum rerum libri Epistole*, 19.10). Petrarch reminisces about their youth together in some detail in one of his later letters (*Rerum senilium libri*, 10.2). In this letter, he remembers their experiences at school and at the universities; and he recalls their first trip to Vaucluse in 1315 or 1316, accompanied by *ser* Petracco and one of Guido's uncles, also named Guido Sette. It seems unlikely that Guido received this letter, as he died around the time it was composed, in the summer of 1368.

Sexuality

Attitudes toward and beliefs about human sexual feelings and behavior in medieval Italian society were complex and frequently ambivalent. Sexual activity, or even a mere reference to it, was often accompanied

by strong attraction and deep aversion, at times even bordering on horror—by intense fascination coupled with strong feelings of guilt, shame, and dread. Literary records, theological discussions, medical texts, and court documents all testify abundantly to widespread concern with sexual matters among the learned and the ignorant alike, as well as to an equally widespread conviction that sexual attraction or indulgence was dangerous, immoral, and likely to lead to disaster both in this life and in the next.

This nearly universal ambivalence about sexuality resulted at least in part from a clash of values: the ascetic ideals of a clerical elite, who rejected sensual desires and passions as gross and impure; and the wish and inclination of most people to reproduce and to enjoy the carnal pleasures that accompany copulation and orgasm.

From an early period in the history of Christianity, many eminent religious authorities maintained that only those who totally renounced sexual activity could be assured of salvation, and conversely that worldly indulgence in sensual pleasures was bound to lead to trouble in this life and eternal torment hereafter. Orthodox churchmen, to be sure, also felt obliged to maintain that Christians could marry and that married Christians might, at least occasionally, indulge in sexual intercourse with each other without thereby necessarily forfeiting their chances of eternal bliss. But even such cautious concessions to libidinal urges were seen as dangerous, and married couples were sternly reminded that their sexual encounters must be properly motivated if they were to escape damnation. Sex before marriage was condemned, at least in principle, by numerous church councils and patristic writers. Sex after marriage, according to standard teaching, might be condoned only when the partners were determined to produce a child or if there was imminent danger that without the libidinal relief of conjugal intercourse, the husband or wife might succumb to the temptation to indulge in some sort of extramarital dalliance. And even under these circumstances, theologians and confessors darkly hinted that the party who initiated marital relations probably sinned thereby, although the spouse who consented to the other's desire might escape moral blame. Moreover, confessors and preachers strongly encouraged married couples to renounce sexual relations entirely once they had produced enough children to continue their family line and had reached the

presumably safe haven of continent middle age.

The beliefs and teachings of the clerical elite often encountered skepticism and even outright rejection among the laity. Popular culture held that sexual desires were natural and inevitable and countered learned advocates of restraint and abstinence with the vulgar argument that if God had not intended men and women to experience sexual pleasure, he would not have endowed the genital organs with the capacity to produce such exquisite sensations. Moreover, attempts by the clergy to persuade laymen to restrict sexual expression rigorously or even forgo it altogether conflicted with the economic and social interests, as well as the libidinous inclinations, of the general run of the laity.

The clergy insisted that sexual expression ought to be confined solely to relations between married couples and that even there it was scarcely possible to have intercourse without at least some taint of sin. Accordingly, preachers and confessors warned couples to refrain from sexual relations for a large part of the year. The clergy admonished married persons that they must not indulge in sex on Sundays or feast days; during Lent and Advent, when fasting, during abstinence, or when other kinds of penance were prescribed; or during other solemn periods of the liturgical cycle, such as Whitsuntide. Clerical opinion likewise disallowed intercourse during menstruation, pregnancy, and the lengthy period following childbirth while the infant was still nursing. Moreover, even during the relatively brief periods when churchmen countenanced marital sex, couples were warned that they must restrain their lascivious inclinations, should not view each other's naked bodies, should not indulge in "obscene" kissing and touching, and should not experiment with novel positions and "whorish embraces." Sexual relations between God-fearing Christian couples, in this view of things, ought to be solemn, serious, sober, and rare.

Marriage itself, largely because it furnished the only approved outlet for sexual expression, was subject to numerous restrictions. Canonists, theologians, and pastoral advisers were greatly concerned with the dangers that intermarriage between closely related families might pose, both spiritually and socially, for the community and accordingly devised elaborate rules to prohibit such unions.

Between the seventh century and the early thirteenth, canonical

rules forbade intermarriage within seven degrees of blood relationship. This policy meant that an individual could not lawfully marry even extremely distant kin, for the circle of forbidden relationships might easily encompass 1,000 or more people, including fourth and fifth cousins. Few people could in practice keep accurate track of such distant branches of their family tree, and there was a very real possibility that any given marriage might be held invalid because it violated the rules on consanguinity. In 1215, the Fourth Lateran Council changed this law; thenceforth, only marriages within four, rather than seven, degrees of blood relationship were prohibited.

Sexual relations of any kind, whether in marriage or outside it, were also prohibited by reason of the legal affinity that existed between individuals and those to whom they were related by legal ties (such as relatives through marriage) or by spiritual ties, such as those created between godparent and godchild or even between persons who stood as godparents to the same child.

Church authorities in principle, moreover, completely banned any sort of sexual relations between any persons who were not married to one another. Such a broad and comprehensive prohibition was impossible to implement systematically, although the practice of periodic confession of sins and the imposition of penance for them helped to facilitate the enforcement process. Church courts at the local level also attempted to enforce the precepts of sexual morality when offenses became public and notorious. "Presentments" (the term used by ecclesiastical courts to describe prosecutions) for fornication and adultery made up a large part of the business of many ecclesiastical courts; and the fines imposed on convicted offenders, although individually usually fairly modest, no doubt yielded a considerable aggregate income. Nonetheless implementation of the precepts of sexual morality posed enormous problems and was, in practice, only intermittently effective.

Although the medieval church was in principle committed to enforcing a rigorous code of sexual morality, its supervision of sexual behavior was far from consistent. A particularly striking example of this inconsistency was its ambivalent policy toward prostitution. In theory, of course, promiscuous sexual behavior was morally unacceptable, and the mercenary exchange of sexual favors in return

for money or other property aggravated the sexual offense and made it doubly damnable. From the patristic period onward, however, eminent moralists were prepared to tolerate the activities of prostitutes, even though at the same time they condemned prostitution. This ambivalence was rooted in the belief that prostitutes, morally detestable and socially degraded as they might be, nonetheless served an important function in promoting social stability. Saint Augustine formulated the classical rationale for this policy of practical toleration, arguing that although prostitution was evil, it was also necessary in order to prevent the breakdown of the social structure and preserve an orderly civic life. "If you remove harlots from society," Augustine warned, "you will disrupt everything because of lust" (*De ordine*, 2.4.12). If prostitutes vanished, he argued, sexual passion and desire would inevitably prompt men to turn their lustful attentions to respectable matrons and virgins, and this in turn would fatally undermine the social order and lead to chaos.

Civic authorities in medieval Italy followed the theologians and canonists in adopting Augustine's argument and applying it in practice. Although they continued to deplore prostitution, they sought to regulate it rather than abolish it. Municipal statutes at first endeavored simply to discourage streetwalkers and to confine prostitutes to brothels and specific quarters of the towns. By the mid-thirteenth century, many cities were requiring prostitutes to wear special kinds of clothing and other distinguishing signs designed to mark them out from respectable women. In the fourteenth and fifteenth centuries, some northern Italian towns went even further and transformed prostitution into a public utility. They established official municipal brothels, owned by the community and operated for profit by designated officials or private contractors who shared the proceeds of their operations with the public treasury. This practice died out abruptly, however, in the mid-sixteenth century, for reasons that are not altogether clear.

Italian civic authorities also became greatly agitated during the fourteenth and fifteenth centuries by the problem of homosexual practices in their communities. Before 1300, cities had occasionally adopted legislation banning male homosexual acts and imposing penalties for behavior they considered sexually deviant; and during the later Middle Ages statutes of this sort multiplied rapidly and at the

same time became much more severe. Men convicted of homosexual acts, even when both parties had consented, were liable to confiscatory fines, and many cities decreed that they were to be burned alive in the civic *piazza*. Some cities, such as Bergamo, not content with public burning and forfeiture of property, also insisted that the condemned man's family be compelled to witness the execution and not be permitted to leave until the fire was extinguished. Actual case records suggest that the most savage statutory punishments were reserved for particularly vicious cases, such as homosexual rape, and that ordinary offenders were more likely to be whipped, fined, and exiled rather than burned alive.

Sexual violence, especially against women who were seen as defenseless—such as servant girls, widows, and married women whose husbands were frequently absent—was a recurrent problem for medieval Italian communities. Incidents of rape by individuals or gangs of young men were common, and municipal statutes usually mandated severe punishments, often the death penalty, for the perpetrators. In practice, however, offenders were only sporadically apprehended; and when they were caught, they seldom suffered the full penalties prescribed by law. Well-to-do rapists routinely settled such complaints by furnishing the victim with a dowry sufficiently large to enable her to marry. She seldom received any further compensation for the pain, outrage, and humiliation that she suffered and that inevitably tarnished her reputation and social standing. In general, legislators and judges seem most often to have dealt with rape as a property offense against the parents and family of the victim, rather than as an attack on the person of the victim herself. A number of communes were prepared to void prosecutions for rape if both parties were unmarried and were willing to marry each other, and if the woman's parents would approve the match. Since communes viewed the assault primarily in terms of its consequences for the victim's value on the marriage market, the authorities were usually prepared to settle these incidents once they were satisfied that adequate compensation had been offered to repair the economic damages the affair had caused. In addition, statutes often penalized lesser sexual assaults that stopped short of intercourse, such as kissing and fondling a woman against her will, or verbal molestation and harassment. Here, too, legislators and judges seemed primarily

concerned with compensating families for the victim's impaired marriageability rather than with punitive measures to satisfy the victim or to discourage similar conduct by others.

Since medieval Italian authorities construed consent to marriage as implying unconditional and irrevocable consent to sexual relations, they were not prepared under almost any circumstances to penalize sexual violence, no matter how savage and barbarous, by a husband against his wife. Intervention by public authorities to protect married women against their husbands was exceedingly rare; the few known instances of such intervention invariably occurred when the wife's family protested publicly and threatened such horrific political consequences that officials felt obliged to take action.

Sexual activity among the clergy raised special problems for medieval Italian society. A celibate lifestyle, insulated from all sexual entanglements, had been held out since the early fourth century as an ideal to which all clerics, secular as well as monastic, ought to aspire; but during the early Middle Ages few serious efforts were made to require ordinary parish priests to abandon their wives and children and forsake the domestic comforts of married life. Church reformers in the eleventh century saw matters differently, though. Reform-minded prelates, such as Saint Peter Damian and Cardinal Humbert of Silva Candida, argued that marriage, and in particular marital sex, was absolutely incompatible with the sacred duties of the priesthood. Not content with urging priests to remain unmarried, these reformers maintained that clergy of all kinds must be forcibly required to abstain from every kind of sexual activity on pain of forfeiting their clerical status and duties. During the pontificate of the stubborn and doctrinaire Gregory VII (1073-1085), the papacy adopted the reformers' program as its official policy and demanded promises of celibacy from all clerics as a requirement of canon law. Enforcement of this new policy proved exceptionally difficult. Reforming bishops bent on imposing it on their reluctant clergy were sometimes physically attacked, and even killed, by outraged priests. Clerics resented demands that they throw their wives and children out of their houses and strenuously resisted the reforms as an unwelcome novelty; and ordinary laypeople also viewed the policy as unwise and even dangerous. It was commonly feared that if priests and other clerics were deprived of their wives, they would be

all too likely to seek sexual outlets elsewhere and would turn to the wives and daughters of the laity for the sexual and emotional solace they could no longer find in their own households.

However, despite fervent opposition and despite the turmoil and suffering that celibacy entailed for many generations of priests, their wives, and their children, successive popes insisted that the celibacy decrees must be obeyed and defended the new sexual discipline for the clergy on the grounds that it was essential for both the spiritual and the material well-being of the church. Slowly, gradually, and for the most part reluctantly, the clergy began to conform to the new order. The grounds of argument shifted somewhat after the first and second Lateran councils (1123 and 1139) made it impossible for clerics to contract legally binding marriages in the future. Many parish priests thereafter continued to engage in casual, short-term relationships with prostitutes and married women, while a good many others settled into long-term relationships with concubines. Throughout the High and later Middle Ages, accordingly, the focus of the campaign for celibacy shifted to attacks on concubinage and casual sex, rather than marriage, among the clergy. Although the leaders of the medieval Italian church never completely succeeded in eliminating sexual activity among the rank and file of the lower clergy, it became increasingly uncommon after c. 1200 for bishops and other prelates to live openly with acknowledged concubines.

While hostility, suspicion, and aversion to human sexual activity dominated the teachings of the clerical elite, medieval Italian laymen and laywomen clearly did not fully share the apprehensions or heed the warnings of their spiritual guides about the spiritual dangers that attended sexual activity. The thirteenth and fourteenth centuries saw increasingly vigorous expressions of lay opinions that celebrated the joys of carnal pleasure and affirmed the importance of sexual experience in human life. Writers as different from one another as Dante, Guido Cavalcanti, Cino da Pistoia, and Boccaccio extolled the virtues of human love and the sensual pleasures that usually accompany it. Tension between these profoundly differing approaches to human sexual experience has continued to mark Italian society, as well as Italian thought and literature, through much of modern history.

Ships and Shipbuilding

The shipbuilding traditions of medieval Italy were part of a wider Mediterranean tradition that had evolved continuously from ancient times. The ships of ancient Greece and Rome are the starting point from which we can begin to understand the evolution in types of ships and building methods that took place during the Middle Ages, Mediterranean ships are often classified into two types: round and long.

Round ships are thought of as pure sailing vessels intended for mercantile use; long ships are thought of as warships propelled by oars and sailed only incidentally. This is an oversimplification, but these two ancient types give us a basis for understanding the ships of medieval Italy. For us in the present day, the typical round ship of the medieval Mediterranean is the great sailing ship, known as the *navis*; and the ideal type of the long ship is the galley. There were also many intermediate types, such as the *bucius* and the *tarida*. In addition, the division of labor between war and peace was not immutable. Large sailing ships with their towering sides and lofty fighting tops, though slow and awkward, could be formidable in defense. Swift galleys, with their large, well-armed crews, were ideal for the transport of cargoes of great value but little bulk, such as precious metals and jewels, silks, and spices.

General Developments in Shipbuilding

Hulls of ancient Mediterranean ships were shell-built; that is, the shape of the hull was built up with planks joined edge to edge with closely spaced mortise and tenon joints. Internal framing was then shaped by adze to fit the curves determined by the plank shell. This construction process was exceedingly labor-intensive. It required chiseling out thousands of mortises, carefully fitting each pair with tenons that were drilled and pegged into place as each plank was carefully shaped and curved to fit its neighbor. Each vessel required an enormous investment in man-hours and wages, but the system produced vessels that were very strong and durable, and so well-fitted that they required little or no caulking. The planks swelled when they were wetted, and a coat of pitch was sufficient to render them watertight. In the late 1960s, archaeologists excavated two Byzantine wrecks at Yassi Ada off the western coast of Turkey, one from the fourth century and the other from the seventh century. The hull of the fourth-century vessel had been built using the methods outlined above, but it showed some cost-cutting modifications. The centers of the mortise and tenon joints were about 10 inches (25 centimeters) apart, roughly twice the distance observed in excavated wrecks from the Roman period. The tenons were

also tapered and fitted loosely, rather than tightly as in earlier construction. This hull was not so carefully built as those from an earlier age, but it would have required less labor, and less skill in its construction. The seventh-century ship from the same site was shell-built only up to the waterline, at which point frames were built in and the remaining planking was nailed on. The builders had placed the mortise and tenon joints of the shell-built portion of the hull even farther apart than those in the fourth-century ship. They seem to have used these vestigial joints only to establish the curve of the planking giving the basic shape of the hull before they inserted the frames. The mortises and tenons did not contribute to the strength of the hull. These ships document an evolution toward an entirely new system of shipbuilding. The new system relied on a framework of ribs that was erected on the keel between the stem- and sternposts; planking was then attached to the ribs, or frames, to complete the hull. This system of building was, by ancient standards, slapdash and flimsy, but it was also quicker and cheaper than the ancient methods. The frames that now provided much of the structural strength of the hull were heavier than those in ancient ships, and the planking became thinner. Italian ships in the early Middle Ages were probably not very different from these Byzantine vessels.

The skeleton building system, though less elegant in workmanship, is technically more advanced than shell building in at least one respect: it requires a more sophisticated understanding of design so as to predict the lines of the hull and determine the shapes of the ribs before the planking is attached. This is not a simple undertaking. The basic proportions of the hull had to be determined: its length, its height, and its maximum width (or beam). Then within those measurements the hull had to be shaped into a smooth series of curves that was a result of an interacting chain of compromises between carrying capacity, speed, and sailing characteristics, which in turn were a result of centuries of craftsmanship and tradition. Not until the fifteenth century, however, do we have written evidence showing the workings of the design process of skeleton building in medieval Italy. Undoubtedly there was much development over a period of 700 years, but it seems likely that certain basic principles remained the same. Certainly there was no use of plans, either early or late. In the fifteenth century, a series of

geometric relationships based on a few fundamental measurements enabled the lines of a vessel to be worked out with a high degree of accuracy. In an earlier age, perhaps a master builder determined the curves of the hull with a practiced eye, but that would have been very difficult without the run of planking to act as a guide. Even in the early Middle Ages, builders must have had some form of guidance.

Nautical archaeology has provided direct evidence of hull forms and construction techniques, but rigging and sails have not survived to be excavated. Evidence for these important features has to be taken from contemporary representations: miniatures, mosaics, sculpture, and even graffiti. These representations were mostly made by landlubbers who often followed well-established traditions, and frequently images of ships were only incidental to the purpose of the illustration. Therefore, these depictions are often lacking in detail and may portray types that had long been in use when the image was made. Great care must be taken in reaching conclusions based on depictions, especially from only a few examples. There are many images of ships from the late ancient period—some with a high standard of representation—that provide a good idea of Roman vessels. Roman ships typically carried a single, wide, low square sail on the mainmast with, occasionally, triangular topsails above that. Inclining over the bow at a sharp angle was a mast, almost a bowsprit, which carried the *artemon*, or steering sail. Medieval representations, on the other hand, usually show the triangular fore-and-aft sail that we know as the lateen sail. It is now generally thought that various types of fore-and-aft sails were known to the Romans but were not commonly used by them. Sixth-century mosaics at the Church of Sant'Apollinare in Classe show a square sail on one of three ships in the harbor at Classis, the port of Ravenna (the other two lie under bare poles). Ninth-century Byzantine miniatures indisputably show lateen sails, but art historians have suggested that these were copied from even earlier originals, indicating that the lateen might have been common much earlier. In later medieval illustrations, the lateen is virtually universal. Since the lateen sail became common around the Mediterranean at about the time of the expansion of Islam, it was once thought that the Arabs introduced this sail there. Evidence now available suggests that the lateen sail in fact originated in the Mediterranean and diffused outward to as far away as the Indian

Ocean.

The advantage of the lateen over the square sail that was dominant in classical times and on postmedieval sailing ships is that a fore-and-aft rig can sail "closer to the wind," as sailors say, than a square rig. This is not to suggest that medieval lateen-rigged ships could sail as close to the wind as modern sailboat designs. Other factors than the rig play a part in the performance of sailing vessels. Modern sailboats have deep keels or centerboards that resist sideways movement (leeway) and contribute greatly to their ability to sail close to the wind. The shallow keels and tubby shape of medieval round ships would have allowed them to make a great deal of leeway when reaching or close-hauled. Still, the lateen rig must have conferred some advantage, most likely agility, over the square rig that it superseded. As the Romans' control of the sea disintegrated, and piracy and warfare became endemic, a ship that could sail even a little closer to the wind than others was very desirable.

Until c. 1300, both sailing ships and galleys of the Mediterranean were directed using twin rudders positioned near the stern on each quarter. The helmsmen turned these quarter rudders around the axis of their shafts using a tiller that projected inboard. A late twelfth-century miniature from the Genoese chronicle of Ottobono Scriba depicts such a quarter rudder with a trailing fin plainly designed to be rotated on its axis to steer the ship. In narrow vessels one man could have handled both rudders, but in large ones the breadth of the beam would have required two helmsmen. Early in the fourteenth century, Italian shipbuilders began to adopt a northern type of ship known as a "cog," which had a centerline rudder hung on its straight sternpost. From this time on, the stern rudder began to replace steering oars.

Galleys

Swift oared warships were characteristic of the Mediterranean from ancient times well into the early modern period. The medieval galley was a descendant of the Roman *liburnian*, though perhaps not a linear descendant. The *liburnian* was, originally, a light, fast pirate vessel which the Romans adopted at the end of the Republican period as a

weapon against pirates. It was long and slender with one or two banks of oars, a square sail and *artemon*, and a ram beneath the water at the bow designed to hole an opponent's hull and swamp him. The Byzantine warship known as a *dromon* still preserved many of the characteristics of the *liburnian*, including rowers disposed in files that sat one above the other. The *dromon* had a reputation for speed—the name means "runner"—and carried a formidable array of armaments including spigots to project the incendiary mixture known as Greek fire. Yet the *dromon* must also have had some real limitations. Contemporary illustrations seem to show a vessel whose upper bank of oars worked directly over the sides of the hull, while the oarsmen of the lower bank rowed through holes in the hull. These ports for the lower bank of oars must have presented a problem in heavy seas. Any rowed vessel must place the rowers close to the water; too steep an angle between oar and water destroys mechanical efficiency, so the lower bank of oars must have been very close to the *dromon*'s waterline if the upper bank was to be at all efficient. Even if the oar ports were fitted with leather gaskets to keep out waves, it must have been very difficult to row from the lower position in rough weather.

In addition to the *dromon*, the Byzantines had a small, fast scouting vessel called a *galea*, with a single bank of oars. The warship of the Italian cities was the galley: *galea* or *galera* in Italian, *galia* in Venetian. The continuation of a name is not proof that one type of ship was derived from another—there have been many different kinds of vessels over the centuries called frigate—but it does seem possible that the medieval galley was descended from the Byzantine *galea*. By slightly increasing *the* beam of the *galea*, two men could work from a single bench, creating the same ratio of power to length as in the *dromon* without the awkward lower oar ports. One more development, a kind of outrigger to aid rowing, which may have been present on the original single-banked *galea*, completed the change. The *apostis*, a heavy beam running almost the entire length of either side of the galley, carried the tholepins against which the oars worked, as well as a bulwark to protect the rowers. It moved the fulcrum of the lever that was the oar outboard, minimizing the difference in the lengths of the loom of the oars of the outboard and inboard rowers, making synchronization of their strokes easier, and also increasing their

mechanical advantage, allowing them to pull longer oars. This method of rowing with first two, then three, men to a bench, each pulling his own oar, was called *alla sensile*. Working longer oars over an *apostis*, the galley may well have been faster and more seaworthy than the *dromon*. These advantages would account for the emergence of the galley as the principal warship of the Mediterranean by the early thirteenth century.

Medieval galleys are spoken of as being "bireme" or "trireme"; this terminology can lead to some confusion, since the terms are also used for rowed warships of the Greco-Roman period built on entirely different design principles. The oars of the Greek warship were disposed in three banks, one above another. Like the Roman *liburnian* that succeeded them, these Greek triremes mounted a heavy bronze-covered ram on the bow at or just under the waterline. In contrast, the medieval galley had its oarsmen seated all on the same level and, instead of a ram, the upper part of the bow extended in a beam tipped with iron, called the spur. The spur was used not to puncture an opponent's hull, but to smash over his upper works, holding him fast and providing a boarding bridge for marines. The medieval galley was more heavily built and, with less power in relation to its length, was probably significantly slower than its classical predecessor, though it may have been more seaworthy.

Thirteenth-century galleys were very long, slender, and low in the water, much like a large-scale racing shell. In 1275, Charles I, the Angevin king of Sicily, issued an order for the construction of several galleys that now provides the earliest evidence for the dimensions of these bireme galleys. In modern terms, they were to be about 130 feet (39.3 meters) in overall length; the beam, or maximum breadth of the hull, was about 12 feet (3.67 meters); and the height amidships from keel to deck was somewhat less than 7 feet (2.03 meters). The ratio of length to breadth, an indication of the slenderness of the vessel, was very high, 10.7:1, about the maximum possible if structural integrity was to be maintained and perhaps a little too great for a wooden ship. These galleys may have had a tendency to "hogging," the term used when the bow and stern sag lower than the midships as the vessel rises and falls on the waves; the results can be disastrous if the keel breaks. We can deduce from their dimensions that these vessels were biremes.

A gangway about 2.2 feet (two-thirds of a meter) wide, known as the *corsia*, ran down the center of the galley. The *corsia* eased movement between the stern and bow. Perhaps even more important, it acted, together with the heavy planking that connected it to the hull, as a kind of box girder, adding greatly to the longitudinal strength of the vessel. By deducting the width of the *corsia* from the beam and dividing by two, we find about 5 feet (1.5 meters) on each side where the rowers could sit, giving about 2 feet 6 inches (0.75 meter) for each rower. With twenty-two or twenty-three benches on a side, two men to a bench, there would have been eighty-eight to ninety-two rowers.

Toward the end of the thirteenth century, galleys were built that added a third rower to each bench. To accommodate this increase in the number of rowers it was necessary to increase the breadth of the vessels. A Venetian trireme galley of 1324 had an overall length of about 128 feet (38.9 meters) and a beam of 16 feet (4.86 meters). A Genoese galley of 1333 was about 132 feet (40.1 meters) long and 16 feet 6 inches (5.03 meters) in breadth. The length-to-beam ratio of both these vessels was 8:1, still very fine, but not so fine as that of the galleys of Charles of Anjou. This increase in beam allowed another file of oarsmen to sit on each side of the galley, producing approximately a 50 percent gain in horsepower available for rowing. It probably also produced a more robust hull. Because of increased weight and breadth, which brought increased friction through the water, a trireme galley would not have been dramatically faster than a bireme. A rise from 6.5 to 7 knots in the maximum speed that the oarsmen might sustain for twenty to thirty minutes is about what might have been achieved. There may also have been a proportional increase in cruising speed sustainable over a longer time. These are conservative estimates of the dash speed that galleys of this type might have reached, and there is some evidence that they could—under ideal conditions—attain perhaps a knot more. This half-knot advantage in dash speed, though not spectacular to modern readers, could be tactically significant. A galley's crew could sustain maximum effort for no longer than twenty minutes, during which time the vessel might cover 2.16 nautical miles at 6.5 knots or 2.33 nautical miles at 7 knots. This would have meant a difference of something like 330 yards (300 meters), or roughly ten galley lengths. After the development of the trireme galley, builders

experimented with a fourth, and even a fifth, rower on each bench, still with individual oars, in an attempt to gain yet more horsepower in relation to the length of the vessel. These experiments apparently did not prove successful, and the trireme became the standard *galea alia sensile*. However, the change from bireme to trireme produced even more significant developments than a gain in tactical speed over short distances.

The broadened beam that made room for another file of rowers also significantly increased the carrying capacity of the galley. Long, narrow, shallow of draft, and packed with rowers, galleys were never efficient cargo vessels. Early bireme galleys escorted merchant ships but were only rarely used to carry goods themselves. There are a few Genoese freight contracts of the mid-thirteenth century that record charters for bireme galleys to transport cloth between southern France and Genoa. The amounts involved indicate that they had a capacity of around 30 deadweight tons. An early fourteenth-century contract over the same route reveals a trireme galley that transported a cargo of about 100 deadweight tons. In short, a 50 percent increase in crew allowed a threefold increase in cargo capacity and an approximate doubling of the number of tons per man that a galley could transport. Galleys were still suitable only for cargoes of great value taking up little space, but for those cargoes they were very attractive because of their speed, their relative independence of wind, and their large crews, who could defend them against human threats. Thus began a line of development in which the tension between the demands of the naval and mercantile uses of galleys led to a differentiation in types of galleys. By the mid-fourteenth century, governments legally defined and regulated two classes of galleys: light galleys (*galee sottili*) and great galleys (*galee grosse*). The light galleys were warships par excellence, maintaining the characteristics of speed and maneuverability that were essential to galley warfare, and to them were also reserved the most valuable cargoes of silks and exotic spices on the routes between Italy and the east. The great galleys were broader of beam, with more freeboard, necessarily slower, but more seaworthy, so they were especially useful on the route to England and Flanders, where they had to contend with the notorious weather of the Bay of Biscay. These two galley types, one naval and the other mercantile,

continued to evolve until the end of the fifteenth century, with the great merchant galleys becoming ever larger to accommodate more cargo. Eventually they became primarily sailing ships, with the oarsmen used as an auxiliary engine in calms or to maneuver out of port. Great galleys became especially popular as transportation for pilgrims, probably because the lack of space in which to carry victuals and water forced them to put into port often, allowing the traveler to find fresh food and a bed on solid ground and see interesting sights. By the mid-sixteenth century, however, sailing ships had reached a high level of development, and labor costs had reached such a high level that the merchant galley became obsolete.

At the same time—i.e., the mid-sixteenth century—war galleys got a new lease on life. In the unpredictable wind conditions and relatively calm waves of the Mediterranean, galleys could still offer tactical advantages, if they were suitably armed. In this context, an innovation was developed: several men were put on one large sweep, allowing more than three men to row from one bench (instead of the traditional one man, one oar of the *alla sensile* system). This new system was called a *scaloccio*—ladder style—because of the handles attached to the huge oar, which enabled the rowers to grasp it. An additional advantage of the *galea a scaloccio* was that it required fewer skilled oarsmen. Only the inboard oarsman who guided and controlled the stroke needed to be highly trained; the others needed only a strong back. Evidence indicates that by this time it was becoming more difficult to find skilled oarsmen, and that factor alone would probably explain the development of the *a scaloccio* system. Although the practical limit for rowing *alla sensile* seems to have been three oarsmen to a bench, many more could pull at the large sweeps *a scaloccio*. More power made larger galleys possible. Larger galleys could carry larger contingents of marines and more artillery. Nevertheless, practical limits were quickly reached: about 160 feet (48.75 meters) in length, perhaps just under 20 feet (6 meters) in the beam, with 420 rowers, six to an oar. This was because the addition of oarsmen added power only arithmetically, while increases in the size of the hull added drag geometrically. The system of rowing *a scaloccio* also made possible very large galley-type vessels, such as the galeasses used by the Christian forces with such effect at Lepanto. The galeass was a type of galley very similar to, or even built on existing hulls of,

large merchant galleys that, because of their size, could be adapted to carry a formidable armament of artillery. Though these vessels operated with considerably reduced speed and maneuverability, they retained enough mobility to work with a fleet of galleys. A Venetian galeass at Lepanto was about 160 feet (48.75 meters) long and 40 feet (12.2 meters) in the beam, giving it a length-to-breadth ratio of 4:1, much broader than a light galley or even a *galea grossa* of the fourteenth century.

Besides the galley and its large derivatives, the great galley and the galeass, there were smaller rowed vessels. They were often used in galley fleets as auxiliaries. The *sagitta*, or *saetta* ("arrow"), was a very fine-lined, fast vessel, a little smaller than a galley, though there seems to have been a good deal of variation in size. Documents speak of *saette* with forty-eight to 100 oarsmen. With forty-eight, they were probably rowed with one man to a bench, twenty-four benches on a side, on a vessel as long as a galley, but more finely built. A hundred men must have rowed two men to a bench, and such a vessel would not have been very different from a bireme galley. The *fregata* was used as a tender in galley fleets. It was an open boat rowed by fewer than a dozen men or sailed with its single lateen sail. Towed by the commander's ship, the *fregata* carried messages, transferred personnel, and performed other tasks in the fleet. Some oared ships began their evolution as warships but ended as merchant ships, transformed by the same pressures that produced the great galley. The *panfilo* appears to have been originally a vessel similar to a *dromon* which developed into a merchant ship with auxiliary oars, all on one level. The *tarida* was a flat-bottomed but fine-lined vessel, adapted for sailing or rowing, that was often used as a transport. The *bucius*, at the end of the twelfth century, was another small, oared vessel carrying a rowing crew of some thirty to forty men. By the thirteenth century, there were hybrid types distinguished as *galera-tarete*, *nave-tarete*, and *buzonave*. The *bucius* underwent the most complete transformation; in the thirteenth century it became purely a sailing ship. By 1255, Venetian regulations lump together *navis vel buzo aut buzonavis* as kinds of sailing ships.

Sailing Ships

Less glamorous than galleys, but always more numerous, were the tubby, slow sailing ships. They ranged in size from small, undecked vessels, little more than open boats, to some that were very large indeed. Ships of the early medieval period seem to have been of small to moderate size, rather sleekly built with curving stem and stern, and with two steering oars mounted on either quarter. At the height of the Roman empire, huge ships of as much as 1,200 tons burden had carried grain from Egypt to Rome, but by the seventh century a ship of 300 tons was thought remarkable. As the imperial economy declined, very large ships were no longer needed; and with the splintering of power as the empire crumbled, the sea grew increasingly dangerous. The fourth-century ship excavated at Yassi Ada is probably typical of many ships that sailed the Mediterranean through the centuries. It was about 62 feet (18.9 meters) long and 22 feet (6.6 meters) in the beam, giving it a length-to-beam ratio of about 2.9:1. The seventh-century ship from that site was about the same length as the fourth-century ship, but had a beam of only about 17 feet (5.2 meters), for a ratio of 3.6:1. Its capacity has been estimated at 40 tons. With its more slender shape and, perhaps, lateen sails, the seventh-century ship would have been better able to outsail or outmaneuver the human predators on the Mediterranean.

There must have been many types of sailing ships that operated from the ports of medieval Italy, but we know very little about them. The general term applied to sailing ships in documents is *navis*, which is about as specific as the English word "*ship*." By the thirteenth century, there were some truly large *naves*, approaching, if not quite equaling, the Roman giants; estimates of the capacity of the largest of them range from 500 to 800 tons. Some of these ships we know by name. The Venetian *Roccafortis* is famous for beating off an attack in 1264 by Genoese galleys that had captured the eighteen smaller ships of the Venetian fleet but were unable to assault the towering sides of the great *navis* successfully. The Genoese *Paradisus Magnus* was almost as large, and the *Oliva* is said to have transported 1,000 pilgrims. Most of our understanding of these ships is based on very detailed freight contracts, which were intended to guarantee stowage space for cargo. Since they give us stevedores', not shipwrights', measures, they reveal nothing directly about details of construction.

Modern attempts at visualizing the *Roccafortis* have put its size at about 126 feet (38.3 meters) overall length, 33 feet (10.09 meters) in the beam. Contemporary with the *Roccafortis* were two unnamed ships that Saint Louis chartered from Genoa in 1268 for a crusade. The contracts for these ships are exceptionally detailed and have provided modern scholars with much material for speculation about their design. Auguste Jal, in the mid nineteenth century, drew plans of one of these ships, referring to it as the *Nef X*, and so it has been known ever since. It was only slightly smaller than the *Roccafortis*: the hull of the *Nef X* was about 123 feet (37.4 meters) long overall, and it was approximately 33 feet (10.04 meters) in the beam. There is some evidence that it was not so deep as the Venetian ship. More than 90 percent of the ships sailing from Italian ports probably had a capacity of less than 100 tons.

These *naves* had one, two, or three masts; two seems to have been the most common number, with a single large lateen sail on each mast. The *Nef X*, a very large ship, had two masts; the only evidence for three-masted *naves* is found in Venetian illustrations. It is almost certain that there were different shipbuilding traditions in the various maritime centers of Italy, but the details are now lost to us. The main mast—the forward mast (*arbor de prora*) on lateen rigged vessels—was stepped only a little aft of the point where the stempost joined the keel, perhaps one-tenth the length of the keel, while the mizzenmast (*arbor de medio*) was stepped approximately amidships. The mainmast had a considerable forward rake whereas the mizzenmast was vertical, or nearly so. The mainmast of the *Nef X* was 125 feet (37.9 meters) long; the mizzenmast was 115 feet 6 inches (35 meters) long. The yard for the mainsail, made of two spars, was at least 166 feet (50.3 meters) long, and that for the mizzen was about 149 feet (45.25 meters). Thus these yards were longer than the ship itself, requiring great skill and a large crew to handle them. Almost every contemporary depiction of these *naves* shows an extravagant upswept structure, or at least a pair of crutches, which would secure the yards when they were lowered. Tacking required the crew to raise these huge yards to a vertical position so that their foot could be swung forward of the mast and brought to the other side as the mainsheet was let out and brought in so the sails would receive the wind on its opposite side on the new tack. In a gale, this operation must have been exceedingly hazardous.

About the beginning of the fourteenth century, Italian shipwrights adopted a northern type of ship, the cog (*cocca* or *cocha* in the Italian documents). This was a sailing ship with a single mast that carried a large square sail; it had straight stem- and sternposts and a centerline rudder. The Florentine chronicler Giovanni Villani wrote in the early fourteenth century that pirates from the Atlantic port of Bayonne introduced this vessel into the Inland Sea in 1304 and that the Genoese and Venetians immediately adopted it. Almost certainly, however, cogs had been seen by Italian sailors long before this. It seems likely that the eventual widespread adoption of the center-mounted pintle and gudgeon rudder (so-called because of the hinge arrangement that mounted it to the sternpost) at the beginning of the fourteenth century was the result of a much longer period of adaptation. Shipbuilding in the medieval world was a traditional craft and was therefore conservative, and the advantages offered by the pintle and gudgeon rudder were not overwhelming. The chief disadvantages of the quarter rudder became apparent only in very large ships. Quarter rudders for a large *navis* were huge; one mentioned in a charter dated 1246 for a horse transport for the first crusade of Louis IX has been estimated at more than 11 tons—and the ship required two of them. An additional problem was that the mounting systems for quarter rudders had inherent weaknesses that were especially acute in large vessels. However, it was not possible to successfully hang a pintle and gudgeon rudder on the curved stern of the traditional Mediterranean hull, so changes in design were necessary to accommodate this innovation. Once the process began, it opened the way for a rapid evolution that would transform the ship.

Another great advantage of the cog was simplicity of handling. The single square sail carried reef points that enabled the crew to shorten sail quickly and easily by brailing up a portion of the lower part of the sail. To reduce sail on a lateen-rigged vessel required the crew to lower the immense yard and then send it up again with a smaller sail. The square sail allowed much smaller crews in relation to the ship's size. On the other hand, a square sail cannot sail as close to the wind as a fore-and-aft sail, so some maneuverability was probably lost. Mediterranean shipwrights, accustomed to building ships with more than one mast, began to add masts and sails to aid in handling the ship. The cog did

not, of course, replace the *navis* immediately, but the impression is that by the mid-fourteenth century, even though lateen-rigged vessels with steering oars were undoubtedly still to be seen, they probably struck contemporaries as a little old-fashioned. The introduction of the cog began a period of vigorous cross-fertilization between the maritime traditions of the Atlantic and the Mediterranean.

Once they had adopted the cog, Mediterranean shipwrights soon began modifying it in light of their own experience to produce entirely new kinds of ships. One of their first modifications was to build the hull using their own carvel planking. The typical northern cog was clinker-built: that is, the edges of the upper planks of the hull overlapped the next plank lower down. The Mediterranean tradition had used carvel building in which the planks of the hull were set edge to edge even after the practice of joining the edges with mortise-and-tenon had ceased to be used. A Spanish miniature of c. 1350, which is one of the earliest depicting Mediterranean cogs, seems to show them carvel-built. More significant was the addition of a small mizzenmast carrying a lateen sail, not to add driving power but to help in steering the ship. A portolan chart dated 1367 already showed this innovation. This would have further reduced any sailing advantage of the lateen. The northern sail with its reef points became a sail with a removable lower section, known to the Venetians as a *scoamar* and to the Genoese as a *boneta* ("bonnet"), which could be quickly removed to shorten sail in a sudden squall. With the addition of another small mast far forward, also to assist in maneuvering, and some changes in the forecastle and after castle, especially the development of a distinctive triangular forecastle, an entirely new type, the carrack, had evolved. "Carrack" is a northern term, though the northern vessels were much smaller than the Italian giants that developed in the fifteenth century. The Venetians and the Genoese built huge carracks of up to 1,000 tons capacity. The three-masted carrack—with a great square sail on its tall mainmast to drive it, a lateen sail on the mizzenmast, and a small square sail on the foremast to give it agility—had great advantages. It was much more maneuverable than the *navis* or the cog, and still used fewer men per ton of capacity than the *navis*.

The carrack needed only a few more evolutionary changes to produce the full-rigged ship, of which Columbus's *Santa Maria* was an early

version. The foresail and the mizzen sail were enlarged to provide driving force as well as maneuverability. In some ships a fourth mast, a bonaventure mizzen, was added as the mizzen lateen sail was enlarged. A sail hung under the bowsprit proved more efficient than the sail on the foremast in bringing the head of the ship around. Even with bonnets to help in sail handling, the single mainsail on large carracks was huge. By the mid-fifteenth century, the great expanse of canvas that was the mainsail was divided among several yards. The multiplication of sails provided more canvas for greater drive; at the same time, the sails, individually smaller, were easier to handle. The full-rigged ship with five or six sails became the ship that in the sixteenth and seventeenth centuries carried Europeans to every shore washed by the great world ocean.

Sicilian Vespers

The revolt of the Sicilian Vespers in March 1282 dominated the history of the Mediterranean in the late medieval period, giving rise to lasting conflict between the Angevins of Naples and the Aragonese of Sicily. Although its origins must be sought in the tough government of Sicily by the officials of Charles I of Anjou, it can also be seen as a rebellion against a long tradition of centralized bureaucracy that demanded of the Sicilians funds for wars against the foreign enemies of rulers they rarely saw. It was also a reaction by the inhabitants of Sicily, and particularly Palermo, against the loss of primacy of Sicily within the Sicilian kingdom, which from the time of Frederick II was increasingly governed from Naples and Foggia.

Under Charles of Anjou, whose reign began with his victory over Manfred at Benevento in 1266, Sicily was governed by *secreti* sent from the mainland, many of whom were members of a small group of families from Amalfi and neighboring towns; they had already acquired power under Frederick II and Manfred, and they mainly moved effortlessly toward the court of the Angevin king. Tension between the "Amalfitani" and local nobles was discernible before the revolt broke out. French garrisons in key cities aroused resentment. Grain shortages occurred in an island normally rich in grain, whether because of real famines or because grain was expropriated to feed the king's fleet (as in 1270, when Charles I joined the crusade of Louis IX of France to Tunis). Some historians have emphasized the relative neglect of Sicily in Charles's plans for his kingdom; port installations were improved on

the mainland, but not on the island. Bresc (1986) has argued that the descendants of the "Lombardi," free immigrants from northern and southern Italy who had been actively repopulating the island since the early twelfth century, particularly resented the imposition of taxes and services from which in some cases they could claim customary exemption. For Bresc, therefore, the rebellion had its roots not in the resentment of a "sullen" population of Sicilians dedicated to age-old principles of vendetta—as in Runciman's portrayal (1958)—but in a new population of Latins who had replaced the old Muslim population, and who expected to enjoy the fruits of freedom, as in many other frontier societies.

This helps explain the widespread support for the revolt, but it does not necessarily explain the events of March 1282, when a French soldier insulted a young Sicilian wife outside the church of the Holy Spirit on the outskirts of Palermo. (This fine twelfth-century church, built by Walter Offamilio, now stands in the municipal cemetery.) A struggle broke out, and amid cries of "death to the French!" the Angevin garrisons were massacred. The rebellion spread across the island, by April reaching Messina, despite the attempts of the local nobility, the Riso family, to maintain the Angevins' power. Since Charles was actively building a war fleet in Messina, in readiness for a crusade due to depart for Constantinople later that year, this was an enormous blow to his power.

The revolt must also be placed in the setting of Charles's wider Mediterranean policies. Michael VIII Palaeologos, the ruler of Constantinople, was fearful of Charles's plans to invade the Byzantine empire and to impose obedience to the papacy on the Greek church. Accordingly, Michael is said to have schemed with Charles's opponents, most prominently the southern Italian exile Giovanni da Procida, himself a member of one of the families that had traditionally provided administrative support to the Sicilian monarchy. Giovanni had settled at the court of the ruler of Aragon-Catalonia, Peter III, who was married to the daughter of the last Hohenstaufen ruler of Sicily, Manfred, defeated by Charles and killed in battle at Benevento in 1266. Peter, always insistent on vindicating his rights, became interested in a Sicilian campaign in 1282 and departed for Alcoll (Collo) on the coast of Africa, on a self-proclaimed crusade. Contemporaries such as Pope

Martin IV rightly feared that this was an excuse for Peter to place himself close to Sicily while Charles went east to Constantinople. That Peter intended to take advantage of Charles's absence from Italy to attack Sicily seems certain. However, it is impossible to show that Peter was behind the uprising in March 1282 in Palermo, which happened too early for his plans. Moreover, the leaders of the rebellion, an urban and rural elite who were often at odds with one another, did not turn to Peter for aid once the revolt was under way. They asked the pope, as overlord of the Sicilian kingdom, whether he would sanction the creation of republics in Sicily on the northern Italian model. Naturally he refused, as Charles's greatest ally; and at that point a Sicilian parliament invited Peter to take the crown in right of his wife Constance of Hohenstaufen. Peter landed in Trapani in August 1282 and worked his way across the island, meeting little resistance. His aim was also the conquest of the mainland half of the Sicilian kingdom; and when he and Charles died in 1285, the Aragonese were installed in Calabrian strongholds such as Tropea. However, the mainland remained generally loyal to Charles, perhaps reflecting the more positive attention it had received from the Angevin government.

The Aragonese invasion, supported by a Catalan fleet, led to the outbreak of a twenty-year war—the war of the Sicilian Vespers—in which the French and Majorcan kings supported Charles I and Charles II against the house of Barcelona. Attempts under James II of Aragon, himself briefly the Aragonese king of Sicily, to return Sicily to the house of Anjou were rebuffed by the Sicilians. They elected his younger brother Frederick as their ruler, thereby further prolonging a contest which plunged Sicily into interdict. The conflict also had severe effects on the ability of the Angevins to provide leadership for the Guelf factions in central and northern Italy. Cut off from Sicily, their prime source of grain, the Angevins became dependent on loans from outside sources, notably Florence. It proved impossible to displace the Aragonese from Sicily; and the treaty of Caltabellotta in 1302, though full of imperfections, represented a victory for those Sicilians who had refused to accept Angevin rule.

Sicily

Sicily, the largest island in the Mediterranean, is a link between the western and the eastern Mediterranean. It was therefore an object of invasion and settlement by Phoenician and Greek merchant colonists, who were anxious to secure trade routes giving access to western waters. Sicily was also valued in its own right since the Roman era as a granary, providing *triticum durum*, durable hard wheat with good yields, to consumers across the Mediterranean. Sicily was invaded by Goths and Vandals in the early Middle Ages; it and Sardinia contained important papal estates, for which Gregory the Great expressed concern. Byzantine Sicily, with a capital at Panormos (Palermo), provided vital links with lands farther to the west which were still under Byzantine suzerainty; c. 630 Constans II thought of making Sicily the seat of his empire, but for this and other controversial policies he was murdered in his bath. Sicily long withstood Arab armies; the island was invaded by the Aghlabid Muslims in the early ninth century, but Islamization was apparently slow, since as late as the mid-eleventh

century Muslims accounted for little more than half the population, and Greek was the island's second language. In the east, particularly around Messina, there was a denser concentration of Greeks observing Orthodox rites, while the west and the south had a higher proportion of Muslims. The Jewish population of the island was also extremely ancient; it was a subject of correspondence by Pope Gregory I. There were few if any free Latin Christians.

Under Islam, Palermo became a thriving center of the international trade in slaves, spices, and Sicilian produce, well integrated into the economy and politics of the Fatimid caliphate based in Cairo. However, the Byzantines were constantly aware that a Fatimid presence in the region threatened their own vital interest in the central Mediterranean and the Adriatic, and they managed to hold forts on the coast of Sicily through much of the tenth century. In the mid-eleventh century, the Byzantine military commander George Maniakes once again tried to gain a Christian foothold on the island. Important in the luxury trade were the Jews of Fustat, whose activities are amply attested to in the Cairo Genizah documents, mostly conserved at Cambridge University. By the mid-eleventh century, the island was divided between three competing Muslim lordships; the easternmost of these, that of ibn ath-Thumnah, ruler of Catania, established contact with the Norman adventurers who had already made themselves masters of much of the southern Italian mainland. Typically, the Normans took over as soon as they arrived, and with few but well-trained troops gradually made their way westward to Palermo. Palermo fell to Robert Guiscard (the duke of Apulia) and his brother Roger I (the "great" count of Sicily) in 1072; the last Muslim redoubt, Noto, fell in 1090. Also in 1090, the Normans established loose control over Malta, which throughout the Middle Ages was to be ruled from Sicily. All this was achieved in the face of the opposition not just of the Fatimid Muslims but also of Byzantium, which deeply resented the extirpation of Byzantine power by the Normans in mainland southern Italy. In addition, the German emperors, with an eye on the southern Italian possessions of the Normans, generally refused to accept Norman dominion in Sicily or the south.

The Norman period (to 1194) is often seen as one of the most glorious in the history of Sicily. Roger I (d. 1101) and his son Roger II (d. 1154;

crowned king of Sicily, 1130) showed regard for the interests of the non-Latin population; the Latin conquerors were few, and immigrants came in a slowly increasing trickle. Greek was the main language of administration under the two Rogers, and Muslim scribes were employed at court. Roger II received scholars from the Muslim world, notably the geographer al-Idrisi. Roger II also pursued an active policy of conquest in the Balkans and in north Africa. Buildings were erected in an eclectic style that owed as much to the palaces of Islamic Africa as it did to Byzantium or Rome. Gradually, however, signs of westernization emerged. The trade routes were increasingly dominated by Genoese, Pisans, and Venetians in place of the Cairo Genizah merchants. Old Muslim agricultural skills probably went into decline, and in the next century there were complaints that henna, indigo, sugar, and other specialized products had become rare. Cotton production ceded ground to the further expansion of the wheatfields. The gold currency, modeled on Islamic coinage, was supplemented by western-style silver coinages. Latin churches were built in the major centers, and the crown began to take an interest in the conversion of non-Christian subjects. Since 1098, the ruler of Sicily had enjoyed the status of an apostolic legate, with the right to regulate church affairs on the island. Relations with the papacy remained close, since the Norman ruler was a papal vassal and the popes saw in the Normans their best defense against German power in central Italy (notwithstanding complications such as a bitter papal schism in the 1130s and again in the 1170s). Sees were founded and an attempt was made to establish an Arabic-speaking church; fragments of its liturgy survive in the archive of the Palatine Chapel at Palermo. Latinization proceeded more aggressively under William I (d. 1166) and William II (d. 1189); the latter entrusted the largely Muslim estates in western and southern Sicily to the new abbey cathedral of Monreale (on the outer edge of Palermo), emblazoned with magnificent mosaics in the Byzantine style. Internal tension between the Muslims and the Latins increased, and massacres depopulated parts of southeastern Sicily in the 1160s. New Latin settlers arrived from areas such as Liguria, bringing the dialects out of which Sicilian Italian was to be formed. The Greek church was also on the retreat, although Muslim peasants who converted appear to have preferred to join it rather than the Latin church, which must have

seemed too much the church of the Norman military establishment. On the other hand, the royal court at Palermo remained open to outside influences, such as the Greek texts that were acquired during diplomatic visits to Constantinople. During the twelfth century, Palermo was an important center of translation; this work included versions from the original Greek of Plato's *Meno* and *Phaedo*. The meeting of cultures was expressed in the elaborate robes (many of which still survive in the Weltliche Schatzkammer in Vienna) worn by the Sicilian kings—a combination of western, Byzantine, and Islamic motifs, woven in the silk workshops attached to the royal palace. According to the Muslim ibn Jubayr, who traveled through Sicily in 1184-1185, King William II expected his courtiers to be at least nominal Christians but apparently had few illusions about the loyalty of many to Islamic beliefs and practices.

Under William I and William II, the Muslim population became increasingly restless, and political conflict was generated as well by ambitious Latin nobles and administrators present at the court, such as Maio of Bari and Stephen de la Perche. Nevertheless, the monarchy pursued ambitious schemes of overseas conquest. William I was blamed for the loss of the crown's African possessions (by 1160); but William II raided Alexandria, Majorca, and Thessalonika, capturing Thessalonika in 1185 as part of a campaign against Constantinople. The most lasting political achievement was the forging of peace with enemies in Italy, notably the German emperor Frederick 1 Barbarossa, following the peace of Venice (1177). A marriage alliance bound the German and Sicilian royal families together, and the German emperor dropped his principled opposition to the idea of a monarchy in Sicily held in fee of the papacy. The lack of a male heir clouded the final years of William II; the crown should have reverted to his aunt Constance, wife of the new German ruler Henry VI, but many southern Italian and Sicilian barons were wary of German rule and supported a bastard member of the Norman dynasty, Tancred. In order to vindicate his claim to the throne, Henry VI invaded Sicily (in 1191 and 1194), and he was crowned king of Sicily in Palermo on Christmas day 1194. After his coronation, he brutally suppressed any remaining opposition. However, the Muslim population was by now in a state of continual rebellion. Henry's early death (1197), followed a year later by the death of his wife Constance,

began a period of instability when German warlords competed for control of the young king, Frederick, who had been born the day after his father's coronation in Sicily. Interest groups such as the Genoese acquired lands and assets. The kingdom was much enfeebled; and it took Frederick many years to reestablish royal authority, following the Norman model of centralized bureaucracy. In 1220–1221 and 1231 Frederick issued legislation to rebuild royal authority, and he gradually gained control over the kingdom's major assets, such as saltworks and granaries. However, he was always distracted by his German-Lombard inheritance, and by rivalry with the papacy in central Italy, which kept him away from Sicily for much of his career. The effective capital of the kingdom of Sicily moved from Palermo to Foggia and Naples; and it was in Naples that Frederick founded his state-run university. Disaffection in Sicily was at first mainly concentrated among the Muslims, about 20,000 of whom he deported over several years to Lucera in Apulia; by c. 1240 the Muslim population of Sicily had ceased to exist, and the ethnic, linguistic, and religious composition of the island was basically Latin. However, the depopulation of good land that resulted led Frederick to encourage schemes for land improvement, whether grain production (the profits from grain were vital to his treasury) or specialized crops such as sugar, previously the specialty of the Muslim agriculturists. His reforms to the administration established by the Normans were calculated to retain close supervision of the ports, of inheritance to estates, and of the royal demesne in the spirit of earlier legislation by Roger II and William II (notably the Constitutions of Melfi of 1231). Payments of tribute from Tunis were demanded and received, ensuring large supplies of African gold. This gold was sufficient to mint a spectacular coinage (the *augustales*), impressive not merely for its high gold content but for its neoclassical image of the emperor. Most of Frederick's building programs, however, were concentrated in mainland southern Italy. He did not continue the Islamic tradition of building palaces that had been favored by the Normans, except for a fine fortified palace at Lucera, where he lived in Oriental splendor among the Sicilian Muslim exiles.

The growing conflict between Frederick and the papacy was costly, and Frederick's ruthless search for income from taxes appears to have generated some unrest before his death in 1250. Neither his legitimate

son Conrad IV (d. 1254) nor his illegitimate son Manfred (d. 1266) was able to achieve peace with the papacy, though Manfred's rule probably took a gentler approach to taxation, for fear of further alienating the Sicilians and southern Italians. Italy was polarized between Guelf supporters of the papacy and Ghibelline supporters of the Hohenstaufen; and the papacy's solution to the problem of the Sicilian succession was to nominate its own ruler, which it claimed to be able to do in virtue of the fact that Sicily was a papal fief. However, the Sicilian baronage already had a long-standing tradition of electing monarchs (including Roger II, Tancred, and Manfred), quite apart from a vestigial loyalty to the Norman-Hohenstaufen dynasty that occasionally emerged. The "matter of Sicily" could be resolved only by battle; and Charles of Anjou, the youngest brother of King Louis IX of France, was victorious over Manfred and over Conrad V (Conradin) at the battles of Benevento (1266) and Tagliacozzo (1268). Like his predecessors, Charles was rapidly drawn into wider Italian and Mediterranean affairs, and his inattention to the internal problems of Sicily gave rise to unrest, first in 1268 and then, decisively, in 1282, when the revolt of the Vespers spread like wildfire from Palermo across the island and was followed by an Aragonese-Catalan invasion under King Peter III. Charles had not been seen in Sicily since the chaotic crusade against Tunis of 1270, led by Louis IX; Charles's attention appears to have been focused more on southern Italy, with Naples now firmly established as capital of the kingdom in lieu of Palermo.

Peter of Aragon invaded Sicily not as a Spanish adventurer but as king in right of his wife, Constance, the daughter of Manfred of Hohenstaufen. The Sicilians welcomed him because they saw in him a chance to reduce the heavy burden of taxation imposed by the Angevins (having perhaps forgotten that the Angevins were to a large extent practicing the methods of Frederick II); this was almost impossible to achieve, in view of the heavy cost of the war against Charles of Anjou, which spilled over the Strait of Messina into Calabria. Not surprisingly, some of the rebels defected to Charles, but sympathy for the Aragonese cause dominated the Sicilian nobility and the towns. After Peter returned to Spain to resist an invasion of Catalonia by the French (1283), he left his wife in charge of Sicily. In his will of 1285, Peter took care to nominate his second son James as heir to Sicily, while

his elder son Alfonso was given the Spanish territories of the crown of Aragon. Thus the Sicilians appeared to have regained a native dynasty.

The 1290s saw rapid change, however, as James of Sicily unexpectedly succeeded as well to Aragon-Catalonia (1291) when Alfonso died without heirs. A period began when James dangled Sicily in front of the papacy, hoping to make peace with Rome and the Angevins by abandoning the island, and perhaps gaining something else in the Mediterranean (Sardinia, Cyprus, or even Albania). A central factor in these negotiations was the reluctance of the Sicilian nobility to welcome back the Angevins; rather than compromise, they elected the lieutenant-governor of Sicily, James's younger brother Frederick (known as "Frederick III"), as their king (1296), creating an extraordinary situation in which James of Aragon and Frederick of Sicily were on opposing sides. Pope Boniface VIII offered James Sardinia and Corsica if he would vacate the island, but Frederick withstood papal interdict and excommunication until peace was agreed on at Caltabellotta (1302). According to this peace, Frederick would remain king of "Trinacria" until his death (the island's new title was classical whimsy), whereupon the island would revert to the Angevins, who retained the title "king of Sicily" even though their rule was now confined to the mainland. (In the long term, this gave rise to the concept of the "two Sicilies," island and mainland.) There is no doubt that the war of the Sicilian Vespers between 1282 and 1302 wreaked havoc on the island, damaging the economic infrastructure and striking a heavy blow at religious life. Frederick worked hard to reconstruct the island's religious and economic life up to his death in 1337, but his task was rendered difficult by continued tension with the Angevins, who were irritated at Frederick's nomination of his son as heir to Sicily (the title "Trinacria" having been rapidly forgotten). Baronial power advanced as the crown made concessions to secure its position in the face of external threats.

A series of royal minorities after Frederick's death led to an effective division of the island between competing interest groups, notably the so-called Latins and Catalans. Families such as the Chiaramonti were openly favorable to the Angevin invaders, and at times in the 1360s vast areas of the island were held once again by the mainland kings of Sicily (Milazzo was occupied by the Angevins for particularly long periods). Messina suffered from difficulties of access to the mainland, which had

long been its prime market. Catalan businessmen, alongside Genoese traders, were dominant in the markets of Palermo and Trapani, and drew wheat from the island to meet the needs of cities such as Barcelona and Ciutat de Mallorca (modern Palma). However, the arrival of the black death in 1347 accentuated difficulties, as production fell and markets shrank because of high mortality. What had been one of the wealthiest and most efficiently organized kingdoms in Europe was now the plaything of four main noble factions, and royal power had shrunk to the point where even control over capital crimes was vested in great baronial families, something that would have been unthinkable in the days of Roger II.

The mid-fourteenth century does, however, represent a low point. Thereafter, the Neapolitan Angevins were so heavily engaged in their own bitter internal rivalries that they presented little threat to the island. The Aragonese king, Peter IV, conceived the idea of a marriage alliance to bring Sicily under the authority of a monarchy that already included the Mediterranean islands of Majorca and Sardinia, with an eye in part on the benefits to be gained from the grain trade. At the end of the century, Martin the Younger, heir to the Aragonese throne, claimed the island of Sicily, invading in 1392. Martin died in 1409 in a campaign in Sardinia, whereupon the crown reverted to his father, Martin the Elder, king of Aragon (making Martin II of Sicily, rather oddly, the father of Martin I). Under Martin the Elder, reconstruction continued; it was now that large numbers of Catalan settlers were granted important fiefs on the island. Meanwhile both the crown and the great barons became increasingly involved in initiatives aimed to improve conditions on the island (and therefore their own income), such as founding regional fairs and encouraging local industries. Population began to recover by the early fifteenth century. The island benefited further from the imaginative policies of Alfonso V, "the Magnanimous," king of Aragon (d. 1458), who conquered southern Italy in 1442 and became the first ruler to exercise power over both Sicilian kingdoms (though as separate entities). He tried to stimulate trade between his Italian and his Spanish dominions, and to encourage the Catalans to buy most of their foreign grain from Sicily. However, there were tensions within the towns during the fifteenth century, as in many parts of Europe; and rivalry between Palermo and Catania turned on

issues such as who should have the island's university. There was also growing hostility to the Jews (who had long retained their use of Arabic in daily speech), culminating in frightful pogroms in several towns in 1392 and again at Modica in 1474. The expulsion of the Jews from Sicily was ordered by Ferdinand II of Aragon in 1492–1493, in the wake of their expulsion from Spain; many moved to southern Italy, where Ferdinand's cousin Ferrante I had been granted the crown. Ferdinand's seizure of southern Italy in 1502–1503 to prevent it from falling into French hands meant that Spanish rule over both "Sicilies" was thereafter long ensured.

Siena

Physical Characteristics and Origins

Siena, an archetypal Tuscan hill town, is situated at about 1,060 feet (322 meters) above sea level. It is in the center of the province of Tuscany, about 30 miles (48 kilometers) south of its perennial rival Florence and 40 miles (64 kilometers) from the Tyrrhenian Sea. Although Siena is surrounded by a number of small rivers and streams flowing through valleys, it does not have easy access to water; still, despite the necessary preoccupation with obtaining water, it was a good defensive site. The city is on the conjunction of three ridges of a spur of the Chiana mountains forming what might be described as an inverted Y. The southwestern spoke of this Y was the core of the early city and overlooked the conjunction of the other spokes, through which passed a main road. The inverted Y shape was to influence numerous Siennese institutions, which often had a tripartite organization based on the three spokes of the topography. The city itself reflected this shape by its traditional division into three sections called the Citta, the Camollia, and San Martino. These three sections of the city also grew up around Siena's position on the strategic Via Francigena, one of the most important roads to Rome from the north. Running through the northern third of the city, the road continued south, turning through the southeastern spoke at the very center of the town. Siena's position on a major north-south artery facilitated commerce, banking, pilgrimages, and tourism as merchants and pious wayfarers passed through the city. The Via Francigena and other roads became a fundamental concern of Siennese governments, especially for the passage of commercial

travelers, merchandise, and foodstuffs.

The province was, and still is, rich in agricultural, alpine, and pastoral products such as olive oil, wine, chestnuts, cheese, and grains. The medieval commune consistently sought to control, and certainly based much of its wealth on, resources from such areas as the Val d'Arbia nearby and those further away such as the Val d'Orcia to the south and the Val di Chiana to the east. To the west, but east of the flat plain leading up to the sea (the Maremma), was another range of mountains, near Montieri; this range was rich in minerals, especially silver and lead. These small regions were the primary objects of conflict with Siena's more distant neighbors such as Florence, Orvieto, Arezzo, and even Perugia, and also with the smaller and closer towns—Montepulciano, Montalcino, Volterra, and Massa Marittima. Siena's geographic position in effect forced it to try, aggressively, to extend its domain in every direction, for reasons of security and for control of natural resources.

The origins of Siena are obscure, but over the centuries accounts were devised from various legends and in turn became legends. The myths established in the Middle Ages and elaborated on in the fifteenth and sixteenth centuries gave the Sienese a republican background that was comforting as they reluctantly accepted deference, and ultimately subordination, to Florence and the Medici. Throughout its history the commune of Siena, and apparently its citizenry, linked the origins of the town with republican Rome and early Roman legends, heroes, and traditions.

Siena was not an important town in either the Etruscan or the Roman period. There are ruins and archaeological remains from both periods, but little of substance has been found within the city itself. From the Roman era, there is some dubious evidence of baths (even in water-starved Siena), a forum thought to have been on the site of the present main square (the Campo), and a few temples. Stelae, bits of statues, sarcophagi, and inscriptions do, however, attest to Roman habitation or presence in the area. Pliny the Elder and Tacitus make vague mention of a place that might be the site of the future city. The earliest settlement or stronghold probably existed on the southwestern spoke of the inverted Y, the highest point of the present city—the Castelvecchio in the Terzo di Città.

History and Municipal Institutions

The complex political history of Siena is not easy to present in a short space. We will briefly consider the sources, then the problems faced by the various regimes attempting to govern the city between 1200 and 1400, then their institutional responses, and last the public events of the period, resulting from their attempts to meet the governmental problems.

For the period before 1200, the surviving sources are not very informative, either about events or about the individuals involved. From the 1230s on, one can see the operation of government and identify to some extent the people and interests behind it. From the mid-thirteenth century, we are much better informed because the records of the *consiglio generale* or general council—the main legislative body of the commune—have survived. After the fall of the regime of "the Nine" (*Nove*) in 1355, with a concomitant destruction of many earlier records, the historian faces a huge surviving documentary record several times the bulk and richness of even that of the administratively obsessed Nine. These documents include letters, the records of the main executive body (the *concistoro*), and court and notarial records. The history of the period between 1250 and 1350, which was in general prosperous and successful, is well known and has been well studied; but the history of the turbulent second half of the fourteenth century, although well documented, is still obscure. The basic problems and remedies remained the same; however, the problems became more intense, and those in control responded chaotically and seemed far less successful in meeting the needs of the polity.

The problems facing Siena were very similar throughout its history and are representative of any such collective attempt to become more established. Once a commune was sworn" by its founders, the process of making it a viable political entity involved reconciling the private interests of the inner elite with those of others living in the space that it sought to control. The interests or corporate values of a community of commercially-minded landowners were not always readily accepted or implemented in a world where rights or obligations were just beginning

to be defined and where voluntary devotion to something like a state was feeble. Siena's many regimes made efforts to give their allegedly civic values and interests religious trappings, but they had difficulty being accepted—although some, as in the era of the Nine (1287-1355), were partially successful.

The primary concerns of these governments were as follows: maintaining security, safety, and justice in urban and rural areas; fostering foreign and economic policies that would satisfy numerous and often incongruous interests; suppressing or reducing class conflict; raising resources fairly and reasonably, but adequately to cover variable fiscal needs; and conveying a consistent image of a benevolent, wise, competent administration. The institutions of government clustered around these issues.

A few specific problems can be noted. First, in foreign policy, the commune had to deal continually with an ambitious papacy and with the nearby and equally threatening commune of Florence; both the papacy and Florence were eager to exploit the factions of Siena for their own ends. Second, providing food and security for the citizenry of Siena demanded an expensive and ambitious policy of expansion and control in the surrounding rural areas. Third, Siena constantly faced the implementation of a lordship, either by a local family or by an outside

power; it escaped this fate (unlike many other communes), though only by the barest of margins. Several magnate families tried to monopolize power throughout the thirteenth and fourteenth centuries, but failed. Rural nobles were partially domesticated by policies resulting in their urbanization; urban magnates were consistently given prominent and powerful roles in communal affairs. Antimagnate laws imposed few real limits. This legislation primarily excluded magnates from the highest ruling body in the state, the *consistoro*; but those offices were overwhelmingly occupied by their friends and commercial associates, and all the other governing bodies of the state were usually filled with members of the greatest families. What actually limited the ambitions of the magnates was the tendency of the magnate houses to rival and balance one another, so that no faction dominated by a single magnate family could seize power. However, such a seizure of power became more difficult to avoid during the early fourteenth century, as opportunities for adventure, commerce, and banking abroad dried up; ambitious sons now stayed in Siena and devoted their attention to a struggle for office and power. At the same time, conceptual differences between the patrimony or resources of the state and predatory private interests became harder to maintain. During the fourteenth century, then, confidence in the governing class and the avoidance of signorial control became more questionable.

Nonetheless, the oligarchical republic of Siena, with its complex institutional structure, was preserved well past 1400 except for a vague submission to the Visconti at about that time. The sometimes wise improvisations and legalistic and administrative responses of the government, combined with policies promoting allegiance to the current regime by means of financial commitments to the treasury, did generally succeed in maintaining republican forms and a Sienese identity.

In theory, the chief ruling body of the commune was the *consiglio generale* (general council), usually consisting of 300 or more citizens organized according to the three districts of the city. This body had little legislative initiative, but it was expected to approve measures sent from a much smaller group, frequently called the *concistoro*, or executive committee. This executive organ was based on multiples of three members (as during the regime of the Nine) and exercised real

control over the other organs of the government. Membership in other administrative and governing bodies was granted by this group, whatever its name might be, between 1200 and 1400. Other groups forming the so-called "orders" engaged in factional struggles for positions in the executive body in order to ensure their own dominance and self-perpetuation. The *biccherna*, or treasury, eventually joined by the *gabella*, or tax administration, carried out the fiscal policies of the commune. Offices of the state—such as *podestà*, captain of the people, captain of war, and *senatore*—were devised to assist the commune in maintaining authority and public order. These offices tended to evolve into a system of courts, each headed by its respective officer, with specific jurisdictions. The *sindaco* checked the books of communal officials and committees. The merchant guild, called the *mercanzia*, played a shadowy but important role in various regimes, especially that of the Nine. Special temporary committees, called *balie* and appointed by the *concistoro* for specific problems, became more common over the course of the fourteenth century. These committees tended to be appointed for longer periods and to have more extensive, and less strictly defined, authority and powers, draining power away from the general council in particular. The commune of Siena evolved as a complex and frequently effective system of government, but these institutions did not always ensure the survival of the numerous oligarchical groups that formed the core of the commune between 1200 and 1400.

The earliest surviving documentation for Siena as a political and religious entity comes from the seventh century, when it was part of the Lombard kingdom and was governed by a *gastaldus*, and concerns the beginning of a long dispute with the bishop of Arezzo over diocesan boundaries: Siena and its bishop worked to preserve territory attached to the diocese. When the Franks came into Italy, the Sienese were governed by a count, with numerous associates taking control of the region around the town. The counts in turn came to be supplanted by the bishops. From c. 1125 on, a communal form of government evolved, beginning with a *consolare* form—that is, rule by the tight committee that often had formed the initial core of the sworn commune. This was supplemented by a *podestà* between 1199 and 1234 and was followed by a regime called "the Twenty-Four" (1234-1270), initiating the

nomenclature of regimes by multiples of the three areas of the city. This was the era of Siena's Ghibelline triumphs, which had begun in the twelfth century, when the commune obtained recognition and privileges from Frederick I Barbarossa. On 4 September 1260, with the assistance of German mercenaries sent by Manfred, Frederick II's illegitimate son, the commune inflicted a massive defeat on the Guelph city of Florence; and for a few years thereafter Siena dominated Tuscany. However, Florence won a decisive victory at Colle in 1269. From then on, Siena, which had traditionally been Ghibelline, remained Guelph; any lingering sympathy for the Ghibelline sprang more from local rivalries than from a real preference for the empire over the papacy.

Throughout the thirteenth century, groups that had not been among the original founders of Siena gradually forced their way into communal institutions under the guise of the *popolo*. The government of Siena—still a restricted oligarchy, but now with broader ties to the new merchant class and certain groups of artisans—fell under the control of the Nine in 1287. This very successful group governed Siena until 1355, primarily by virtue of fiscal competence and skillful administration and policing. In 1355, during the presence in the city of the inept emperor Charles IV, a faction eventually called "the Twelve" (*Dodici*) usurped control. The Twelve held control until 1368, when, during another visit by Charles, a clique called the *reformatori* (reformers) seized power, with the temporary help of a magnate family, the Salimbeni. From 1385 until the end of the century, several changes of government occurred, and the various factions steadily evolved into the *monti*, which were from then on Siena's traditional political affiliations. These parties were very fluid during this period: individuals regularly changed sides; and families kept members in all the groups, jockeying for control. Whereas before 1355 the commune had been stable, the end of the century was marked by political conflict, administrative chaos, and the magnates' depredation of the city and countryside.

Economic Life

Several aspects of the economic life of Siena and the surrounding area have been studied by historians, but lacunae in our knowledge and understanding remain. These gaps persist partly because of a lack of interest among scholars, but primarily because of deficiencies in the available sources. What has been studied has had to be approached in the context of certain institutions and perspectives. Much is known about the rise and decline of Sienese business, especially international banking; the taxation of commerce and agricultural markets; the foreign and economic policies of the commune; the development of certain agricultural institutions, especially the introduction of the *mezzadria* or sharecropping contract; rural economic resources; and relationships between communal and other institutions, such as the hospital of Santa Maria della Scala. But important aspects of the economy remain vague or only simplistically understood. Lists of official exchange rates over a long period and wage structures over short periods have been compiled. Distributions of wealth among the citizenry have been carefully charted from the intensive *estimo* of 1316–1320. All these rather momentary pictures of the functioning of the economy are of only limited help in forming a general picture of the economy of Siena between 1200 and 1400. Furthermore, it seems unlikely that the economy can be better understood, given the state of the sources.

The surviving account books of minor merchant companies indicate considerable variety in mercantile activity in the city and foreign markets; but these books are few, vague about the actual companies, and limited to the thirteenth century—Siena's reputed golden age. Sets of records exist for the hospital of Santa Maria della Scala and certain monastic institutions, but they are confined to a single perspective: the efforts of the core ecclesiastical establishments to consolidate their properties and expand their control over the peasants and tenancies tied to them. For the period before 1200, there exist only a few (though excellent) studies, dealing primarily with the economic policies and relationships between great feudal families such as the Berardenghi and monastic houses—again, all that might be available from the sources. Legal records dealing with economic matters similar to those elsewhere in Europe are late and very rare indeed. For instance, written arrangements about how things were to be done or what was to be paid

or owed are plentiful for the agricultural world around Siena, but its actual practices and productivity remain unclear for most of this period.

What is known about Sieneese economic life has therefore necessarily been based on the surviving public records of the commune itself. These records, though rich, are limited. Even the large number of extant charters or *diplomata* from the archives have only recently been more systematically used to supplement public records. Moreover, the private economies of those who exercised power and set economic policy and priorities are only now being studied in order to get beyond mere labels such as "merchants with rural interests." This lack of study of private economies and interests accounts largely for the gap in our knowledge and understanding of the Sieneese economy.

On the other hand, numerous studies have been done on the organization of guilds (which were, however, of much less significance in Siena than in Florence), on the activities of the great merchant-banking companies, and on communal economic policy. Most of the extant sources for economic matters involve these organizations and decisions. Therefore, we know much about how reprisals for economic defaults between the citizens of two jurisdictions were supposed to work, according to treaties; but when firms failed and crises arose requiring direct pleas or negotiations between sovereign states, we are much less fully informed. The economic details—what caused the defaults and the usually hasty departure of the offending obligated parties—are mostly unclear, so either the healthy or the unhealthy functioning of business cannot readily be reconstructed. Markets for all kinds of products have been posited from careful studies of taxes on them; but again, only part of the picture can be gained by this method, as exemptions existed for many persons, so that we can make only partial, though useful, conclusions regarding trends and commodities in an urban market.

With these caveats in mind, several aspects of Siena's sophisticated economy can be described. Probably the most important aspect is the banking and mercantile activity carried out by Sieneese companies, which were among the most successful, most innovative, and richest in Europe during the thirteenth century. This success was built on the ability of several elite Sieneese families to fashion credit instruments so as to assemble the resources to extend wider credit, make lucrative

loans, and carry out the time-consuming activities involved in trading cloth and other commodities. They did this by evolving systems of partnership that offered attractive opportunities to investors and reasonable terms to customers. These patrilineages were accustomed to cooperation from their experience in holding joint rural and urban properties. Whether from urban or rural rents, Sienese merchants were well positioned financially, by the early thirteenth century, to take advantage of growing fiscal needs of the papacy, secular governments, and individuals.

The Bonsignori in particular took their place among the largest firms of the thirteenth century. By the 1290s, however, despite reorganizations and the addition of numerous partners outside the family, the society of the "Great Table" found itself in severe financial difficulties because of its pitifully inadequate reserves. If difficulties arose, all the clever and creative organizational innovations of the previous century would not suffice to give the skittish customers confidence in the company and avoid recalls of debts and deposits and eventually a run on its assets. These assets were difficult to liquidate and in any case could be liquidated at only a small part of their true long-term worth. This led to a long, drawn-out process of bankruptcy between 1298 and 1310 in which the Bonsignori, with the help of the commune, tried in vain to avoid paying their debts, even debts owed to the king of France. In the end they paid little more than the small percentages paid by contemporary Florentine companies, and only to powerful and persistent creditors.

In the decade after 1310, other, considerably smaller international firms based in Siena—such as those built around the Tolo mei, Malavold, and Gallerani families—followed the Bonsignori into ignoble bankruptcy and defaults on debt. During these long processes, the commune of Siena tampered with the principle of joint and unlimited liability of the partners in bankrupt companies. Compounding the usual difficulties involved in tracking down people and assets, the regime for several years limited the liability of each member of a firm to the percentage of his initial investment in the company. In other words, debtors could not collect as much as possible from any individual whom they might be able to detain legally. This made doing business with a Sienese company a much riskier proposition, since assets were

elusive and were protected beyond the usual strict and limited protection afforded to the dowries of wives as first creditors. In the second half of the thirteenth century, these business difficulties were combined with others: Florence became a dominant competitor; Siena's cloth industry had a weak base (due to a lack of water); and the European fiscal environment, now also dominated by Florence, had changed. As a result, Sienese merchant bankers were not able to produce a generation of successors to the Bonsignori or the other failed companies. By contrast, the Florentine companies that had experienced bankruptcy during the same period were replaced by new companies, which were on a slightly sounder fiscal footing and were made more secure and more trustworthy by adherence to the principle of joint and unlimited liability—a principle that was restored too late in Siena. Although other Sienese companies continued to be formed throughout the rest of the fourteenth century, they were never in the same league as the great thirteenth-century firms and mostly confined themselves to the local economy.

The early fourteenth century was the great period of expansion for the fiscal administration of the commune itself. However, a major part of this administrative and fiscal growth sprang from an expensive dependency on voluntary and forced loans, "tax farming," and the pawning of great properties in the *contado* as the regime of the Nine at times became desperate to get funds and accepted terms very profitable to the lenders. The banking and merchant class that was at the core of this regime probably turned to local sources of credit, soaking up resources that in the past had gone into international finance and commerce—which were more risky but ultimately much more lucrative. There is also some evidence that the profits derived from business with the government were not used very productively by the class lending to the commune.

Research on the economy of the second half of the fourteenth century is very sparse; evidently, however, the overall wealth of Siena and its regional economy declined. The black death had caused a major redistribution of wealth among survivors, and the continued production of wealth from more restricted opportunities and resources could not have been easy to maintain. Also, the population never returned to anything approaching its earlier size. This drastic decline in human

resources was accompanied by increased political conflict over control of the commune among groups that had no economic interests similar to those of the business-oriented Nine. Furthermore, the wool industry, such as it was, was devastated by riots in 1371 and by several forced expulsions of artisans from the city. During this period there were also frequent incursions by marauding mercenary bands who caused great destruction in the once rich agricultural areas around the city and extracted huge amounts from the taxpayers of Siena as bribes to leave the area.

By 1400, Siena seemingly had an economy much different from that of 1200 or 1300. In 1200, Siena had been poised on the brink of involvement in a greatly expanding international economy. By 1300, Siena had been drawing inward to a local economy; this local economy was still flourishing but was increasingly tied to a regime only too ready to borrow from itself to pay expenses that were not in the long run of much overall profit to the city or region. By 1400, the Sienese had minor roles in a new generation of Tuscan companies with far more modest resources than their predecessors. All this commerce was set in a Sienese state that was probably producing much less wealth from agriculture and from urban industry.

Urban Development

The urban landscape of Siena as we now see it can reasonably be said to have been constructed by the Nine between 1287 and 1355, although much of the cathedral is earlier. Later building consists mostly of fifteenth-century family palaces and work done on medieval churches. The great Palazzo Pubblico (town hall), with its tower and the *piazza* known as the Campo in front of it, was constructed by the Nine, at the center of the tripartite city, to symbolize their own and the city's legitimacy, wealth, prestige, and power. This regime was very much concerned with its own image and with the ordering of Sienese society. The concept "right ordering" prompted the regime to systematize the streets, regulate (partially) the exteriors of buildings, expand the availability of water by building new fountains and completing old ones, and construct several extensions of the walls and gates. According

to Dante, the Nine also gained a reputation for vanity by searching for a mythical river called the Diana that supposedly ran beneath the city. Tunnels supplying the fountains of the upper parts of the town, and elaborate drainage tunnels, honeycombed the hills on which the city was built. The water supply always remained a concern of the medieval Sienese.

Much of this building was done despite the difficulties presented by the irregular topography of the site. The three sections of the city lie on the tops of ridges of three different heights, which had to be protected by long walls running through valleys containing small agricultural plots. A confused tangle of streets, moreover, could not easily or quickly be made into the desired organic, controllable unit.

In addition to major public building projects, the Nine regularly supported the building of churches throughout the city, and especially the cathedral (*duomo*). This regime inherited much of the present cathedral from an expansion begun in the 1250s and 1260s; and c. 1300 it took control of the *opera*, or works administration, of the cathedral. The Nine finished the exterior decoration, added bays, commissioned several altarpieces by Duccio and Lorenzetti, and tried to associate these spectacular works explicitly with themselves. In the 1330s, they embarked on a huge but impractical expansion of this *duomo*. This was left unfinished after the visitation of the black death in 1348, primarily because of technical problems and the political and economic changes of the 1350s and 1360s.

Besides being prompted by administrative and political concerns, all of this urban development was accompanied and driven by fairly regular increases in the population until the devastation inflicted by the black death. Siena was one of the most prominent victims of the plagues of 1348 and 1362. Reasonable estimates of the population have been made: about 20,000 in 1260; about 50,000 at its peak in the 1330s; and as low as 15,000 beginning in the 1350s and 1360s. With this decrease in population, and with the greatly increased political conflict and economic difficulties of the second half of the fourteenth century, urban development stagnated. The Sienese seem to have struggled to maintain what they had and to have limited themselves to smaller architectural projects within the larger and older spaces already constructed.

Art and Architecture

Between the late thirteenth century and the mid-fourteenth century, the commune of Siena produced and employed some of the most important artists of the period. Duccio di Buoninsegna, Simone Martini, and Ambrogio Lorenzetti were among the most influential painters of the era, well known outside the city and the surrounding region. Working in the shadow of these three figures, many other painters, sculptors, and architects contributed to Siena's enduring reputation for art. Modern studies of their work, especially fresco painting, have led to some extremely complex, and occasionally acrimonious, disputes. These debates have centered on difficult issues of chronology, attribution, repainting, restoration, archival verification, and relationships between images and texts, and have greatly enlarged our knowledge. Still, much remains to be done in all these areas, and consensus will be difficult to reach, especially with regard to the boundaries between art and society.

Certain themes emerge in any attempt to describe Siennese art and architecture. Since the dedication made at the time of the important victory at Montaperti in 1260, the Virgin Mary has been prominent in Siennese iconography; she is portrayed in some of the most important works of art produced by Siennese artists in Siena and elsewhere. In civic, communal, republican, and public culture and patronage, an ideology affirming the value and worthiness of the city's rulers was consistently present. The earthly city and its ruling group were linked to a just environment prompting peace and security in this world and salvation in the next. All this was sanctioned and promoted by the Virgin and God, to whom the commune owed and paid a special devotion. Siennese artifacts should be considered, at least initially, within this civic ritual and devotional context.

In addition to the mendicant churches of Siena, the history of the construction and decoration of the *duomo* and the Palazzo Pubblico can serve to define and exemplify Siennese art between c. 1200 and 1400. The fiscal and spiritual disasters of the mid-fourteenth century altered the patronage behind the "golden age" of Siennese art associated with the regime of the Nine (1287–1355). As a redistribution of wealth deprived the commune of much of its opportunity for, and interest in, promoting its synthesis of civic and religious art, ecclesiastical entities replaced it

as the main sponsor of art and architecture. Accordingly, the content became more explicitly religious.

Very little survives of artistic production from before 1200; only a few altarpieces or fragments and remnants of rural parish churches remain. Not until the rebuilding of the cathedral in the mid-thirteenth century can we identify artifacts, date them, and associate them with any clear provenance. This almost never-ending project of construction and modification was the physical context for the most important sculptors of the city. An earlier church, standing at least as early as 1200, was transformed slowly, in particular after 1245, from a Romanesque structure into the basically Gothic building existing today. Changing liturgical and civic concerns demanded a larger and more impressive structure. Nicola Pisano carved his spectacular pulpit in this new building between 1265 and 1269, assisted by his son Giovanni and Arnolfo di Cambio. Giovanni stayed on in Siena and carved the statues of the prophets and sibyls on the new facade. After becoming a Siennese citizen, he served as the chief architect and master of the works of the *duomo* between 1299 and 1302. It was for the main altar of the *duomo* that Duccio painted his famous *Maesta* between 1308 and 1311. On 11 June 1311, much of the city turned out for a great civic festival accompanying the transfer of the *Maesta* to the cathedral, through the heart of the city. By this time, the commune was taking a careful interest in the *duomo* and was consistently associating itself with the images used to decorate it. Therefore, the commune established close control over the *opera*, the body overseeing the building and maintenance of the cathedral, which was now no longer under the control of the bishop or canons. During the 1330s, other major artists were commissioned to paint large altarpieces for the principal side altars of the cathedral. The association of the commune and the regime of the Nine with the Virgin and the four patron saints of the city (Ansano, Savino, Crescenzo, and Victor) became even more explicit in these commissions. The commune tried to bring art more into the life of the city it sought to control.

The largest buildings in the city during the mid-thirteenth century (although little now genuinely remains from them) were the palaces—or, more accurately, the fortresses—built at the heart of compounds controlled by an urban elite. The commune usually held its assemblies

in these palaces, or in churches controlled by or closely associated with them. Not until the regime of the Nine did the commune set about constructing and decorating a building, the Palazzo Pubblico, that could rival the magnates' palaces or the cathedral in size and prestige. The Nine also created the *piazza* in front of the Palazzo Pubblico—the Campo—by paving the space in the shape of a fan. This space was enhanced by the erection of a tower (between 1325 and 1348), a fountain (c. 1343), and a chapel abutting the recently finished Palazzo Pubblico (between 1352 and 1376). The meeting chambers in the Palazzo Pubblico were decorated by artists such as Simone Martini and Ambrogio Lorenzetti. Simone Martini's fresco of a Madonna in majesty was painted c. 1315 in the great hall, or Sala del Mappamondo. This Madonna, enthroned and surrounded by a heavenly court of angels and saints, was clearly meant to suggest that the commune was being governed with divine guidance.

Two decades later, one of the great didactic works of the Middle Ages was created on three walls of the adjoining hall of the Palazzo Pubblico, where the inner council of the Nine actually met. Ambrogio Lorenzetti (1295-1348) painted, probably between April 1337 and June 1340, the allegorical cycle of frescoes usually called the *Effects of Good and Bad Government*. On the center wall is a representation of virtues surrounding a figure representing good government exercising authority. On the two facing side walls are images of the effects of good and bad government on the city and the countryside. These paintings have been variously interpreted as representing certain ideologies or texts and the reality and practical politics of Siena, and have given numerous iconographers an opportunity to apply their hermeneutical expertise. The frescoes have been linked with several texts or traditions promoting the values and virtues of peace and a republican form of government, even that of the oligarchies controlling Siena. Various sources or traditions for Lorenzetti's ethical and didactic iconography have been suggested, since there is little if any contemporary evidence of his own or his patrons' intent. These traditions include Aristotle, Roman rhetoric, the biblical (the Book of Wisdom), and scholasticism as associated with Thomas Aquinas and Brunetto Latini. The abstract ideas and pictorial conventions in this complex painting remain rich sources for artistic innovation, textual authority, and perhaps even

political realities in Siena.

Sieneese artistic production underwent considerable change in the mid-fourteenth century. It has long been recognized that the fear and guilt arising from the black death—which struck in 1348 and again in 1362—compounded by economic and political conflict, affected the religious and civic context in Siena. (We should note, though, that changes in artistic taste and religious practice can be traced back even earlier in the century.) Several of the most important artists, such as Ambrogio Lorenzetti, died in 1348. Their places in the world of Sieneese patronage were often taken by members of their workshops, so that much of the technique and tradition developed two or three decades before was preserved. However, as the civic tradition deteriorated, the authority of the church and the clergy was asserted more aggressively. Penitential and hierarchical values became more obvious in the work of such artists as Bartolomeo di Fredi, Luca di Tomme, and Bartolomeo Bulgarini. These themes had of course been present in Sieneese art of the thirteenth century and the early fourteenth century; but now the sources of patronage changed, so that art was more specifically tied to the agendas of the institutional church and the distinctions between the laity and the clergy were more clearly defined. At the same time, the empirical, inductive, and quantitative modes of thought of the Sieneese communal ethos became less obvious.

Culture

Sieneese culture was built around civic and religious virtues, but there were profound tensions that increased from the thirteenth century to the fourteenth. These tensions arose from attempts to construct a society in which collective values could be reconciled with particular interests. Republican ideals overlay the harsh realities of a very competitive society characterized by loyalty to family, guild, and neighborhood; by local religious interests; and by economic diversity and political exclusivity. Social integration and the accommodation of diversity were so problematic that violence was often perceived to be close at hand. There were also other values and cultural preferences arising from commercial interests and the commercial mentality, and

From the knightly point of view—which was still vibrant and was sustained by the civic feudalism of Siena's urban environment.

Siena has also been considered a prime example of civic Christianity in which individuals shaped the practice of their piety more broadly than as mere concern with personal salvation. This context fostered ecclesiastical and, to a lesser extent, secular institutions that took an active role in society. Such institutions can be conceived as including the commune itself, because it played an explicit role in ensuring that charity was distributed to the worthy and that both distributive and commutative justice flourished in a polity tied to God and the Virgin.

The main icon of Sienese culture was the Virgin Mary, who [as noted above] was adopted formally by the city as its patroness after its victory over the Guelph Florentines at Montaperti in 1260. From then on, she was invoked in religious devotion and practice and was at the core of much of Sienese religious writing and religious art. The various regimes controlling the city consistently linked her with their own patronage, and in fact with their political power and legitimacy. The Virgin would serve as the point of unification for the sacred and the secular in Sienese life.

Around 1300, the Sienese writer Cecco Angiolieri, although bizarre and extremist in his views, reflected issues of Sienese culture, religion, and ethics. He emphasized the importance of literacy and words as the glue of the commune or voluntary and civil society, and he lamented the tyranny of capital. The vices to be shunned in this world included not only the old-fashioned feudal ethos but also the ills of evolving capitalism, economic development, and competition. Cecco may seem completely self-obsessed, but he and most of the Sienese writers (overwhelmingly religious in one form or another) were concerned with the civic virtues promoted by whoever ran the communal government and its patronage. These virtues included, as one might expect, charity, generosity, circumspection, wisdom, prudence, self-control, temperance, justice, and fortitude—all of fundamental importance in the officially fostered ethical and civic vision of Sienese culture.

A Note on Sources

The selective bibliography that follows includes primarily editions of sources, archival and bibliographical guides, works in English, important older publications, and studies in Italian representative of the work of significant authors. The main journals for the study of medieval Siena are *Rassegna d'Arte Senese e del Costume*, *Rassegna d'Arte Senese*, *Atti e Memorie della Sezione Letteraria e di Storia Patria Municipale della R. Accademia dei Rozzi di Siena*, *Bullettino della Società Senese di Storia Patria Municipale*, *Atti della R. Accademia dei Fisiocritici di Siena*, *Miscellanea Storica Senese*, *Studi Senesi*, *La Diana*, and, especially, *Bullettino Senese di Storia Patria*.

Siger of Brabant

Siger of Brabant (c. 1240-1281 or 1284), an Aristotelian philosopher, is often identified as the leader of an Averroistic faction at the University of Paris. Siger was born in the duchy of Brabant and was educated at Liège. He began his studies at Paris c. 1256, meanwhile receiving orders as a diocesan cleric of Liege. By 1264, he was a master of arts. In the late 1260s, Siger began to publish works subjecting a wide range of issues, including sensitive matters of faith, to rational examination. Here he joined a number of other members of the arts faculty—figures such as Boethius of Dacia and Aubrey of Rheims—who had become convinced, by the recently discovered corpus of Aristotle and its

attendant commentaries by the Arab philosophers Averroes and Avicenna, that philosophy was not merely an adjunct to theology (as it had traditionally been considered in the Christian west) but a semi-independent discipline which should examine questions using its own rational criteria. Many of the conclusions reached by Siger and the other masters conflicted with Christian doctrine. Their arguments for the eternity of the world, for example, contradicted creation by God, and their assertion of a single intellect for all humanity could be interpreted as a denial of the individuality of the human soul. When pressed about the heretical implications of these conclusions, Siger and the others insisted that they were merely experimenting with a method of inquiry and that they in fact believed all the truths revealed by scripture. This led critics to accuse them of holding a "double truth" and to dub them Averroists.

The works of these so-called Averroists stirred considerable controversy. Conservative theologians used the situation to condemn all Aristotelian thought; moderates, notably Thomas Aquinas, sought to defend their own use of Aristotle in theological speculation. In 1270, Aquinas published an attack on the doctrine of the single intellect for all humanity, his *De unitate intellectus contra Averroistas*, which appears to be a response to Siger's *Quaestiones in librum tertium de anima*. In the same year, Etienne Tempier, the bishop of Paris, condemned some of the teachings of the Averroists. These challenges apparently chastened Siger. In works written after 1270, he is careful to assert that he is merely explaining the doctrines of Aristotle and Aristotle's commentators, not maintaining their truth. He also criticizes Aristotle and Averroes for their errors.

In 1266, Siger was acquitted of complicity in a kidnapping perpetrated during a dispute at the university. In 1272, he was elected rector of the university by a rump group that had broken with the main body of masters. Both these incidents were once thought to be evidence of Siger's leadership of a powerful and rebellious Averroistic faction at Paris. They are now considered to be unrelated to his philosophical views. This has led some scholars to reevaluate the motives of the Averroists, and to question Siger's supposed leadership of the group.

In November 1276, Siger and two of his students, Bernier de Nivelles and Goswin de la Chapelle, were summoned before the inquisitor of

France, presumably to answer questions about their orthodoxy. The summons was apparently part of a new offensive by conservative theologians at Paris. Four months later Bishop Tempier issued a very extensive condemnation of Aristotelian teachings. Whether Siger managed to vindicate himself here is uncertain. He seems to have left the university after this incident, and in the early 1280s he was at the Roman curia, then located in Orvieto. He was stabbed to death there by a deranged secretary sometime between 1281 and 1284.

Siger's philosophical work was held in high esteem by some contemporaries, and Dante placed him in the fourth heaven of paradise with Aquinas and Albertus Magnus. However, Siger's reputation faded during the fourteenth century, and historians of philosophy did not rediscover him until the twentieth century.

Silk in Italy

Our knowledge about silk and silk textiles in Italy from the fifth century to the fifteenth, whether imported or indigenous products, rests on both written and material evidence. The written sources, which cover more or less the entire period, are fragmentary and unevenly distributed over time and place, though more abundant since the fourteenth century. The material evidence consists of textiles found in tombs or preserved in museums, ecclesiastical treasuries, or private collections, or else depicted in various artistic media, chiefly in manuscripts and paintings. Research on silk has been mainly conducted by historians of textiles and art historians, who have attempted to elaborate typologies of textiles, especially on the basis of extant pieces. To this effect they have increasingly relied in recent years on scientific analysis of fibers and dyes and paid more attention to weaving techniques, in addition to imagery, iconography, and style in decoration, which had previously been the focus of research. Nevertheless, many attributions to specific regions or production centers, whether in Italy or elsewhere, as well as the dating of various pieces, remain unsure and controversial. Historians of textiles have published some general surveys covering the manufacture of silk textiles in specific cities or areas of Italy over long periods, though generally without sufficient regard for written sources or for the economics of silk. Many important issues in this field require further investigation. They include the financing and organization of silk and

textile production, the provisioning of workshops in silk and dvestuffs, the distribution of finished products, the movement of skilled labor, industrial implements and expertise, and the diffusion of looms and weaving techniques as a result of imitation.

Italy imported silk and silk textiles from the Orient since the time of imperial Rome. It also produced silk fabrics from foreign silk. Sericulture, or the growing of silkworms, reached the Mediterranean under Emperor Justinian I (r. 527-565), and from the eastern provinces of Byzantium it spread westward in the wake of Muslim conquests. This process enabled the manufacturing of cheaper silks in several regions around the Mediterranean, and as a result Italian imports became more diversified.

Silks were used in church vestments, hangings, and furnishings since the early Middle Ages. They were also in demand in the upper ranks of the clergy and lay society. Byzantine silks as well as Muslim textiles, the latter produced in western and central Asia, arrived in growing amounts in Italy from the late seventh century on, and were later followed by fabrics from Muslim Spain. These textiles ranged from plain to patterned and figured pieces, some in twill and others in tabby weave. The most precious among them were highly valued for their texture, colors, and interwoven or embroidered decoration made of gold thread, silk, or other materials, to which pearls and precious stones were occasionally added. Beginning in the mid-eighth century, papal records mention the presence of silks of various origin and nature at Rome. In Italy, the Byzantine emperors, in order to further their policies, granted precious silks to Lombard rulers and, from the eleventh century, also to Norman rulers. However, the commercial flow of silk textiles to Italy was far more important than these grants or than gifts to ecclesiastical institutions. From the late eighth century, Venice, later joined by Amalfi, supplied eastern silks to the annual fairs of Pavia, which until the eleventh century served as the main distribution center for northern Italy and lands beyond the Alps under Carolingian and Ottonian rule. In the tenth and eleventh centuries, Amalfi also imported silks from Muslim Spain and marketed them in southern Italy and in Rome. Nevertheless, Byzantine silks apparently constituted the bulk of Italian purchases. Their importation was furthered by the political relations of Byzantine emperors with rulers in the west, the

Byzantine presence in southern Italy until 1071, and the particular prestige of these fabrics, deriving from their real or supposed connection with the imperial court.

Continuously rising living standards and refinements in daily life account for the appearance of silk fabrics in urban households in southern Italy in the early eleventh century and their progressive diffusion farther north. This demand in Italy was not restricted to sumptuous silks and was more diversified than it had been earlier. From the late eleventh century on, it was furthered by the expansion of Italian trade in the eastern Mediterranean, the crusades, and the increasing flow of pilgrims visiting the Holy Land, all of which led to a growing acquaintance with Byzantine and Islamic silks. In the twelfth century, Genoese merchants joined the Venetians as main importers of silk textiles to Italy.

There was also indigenous production of silks. Sericulture was introduced by the Muslims into Sicily in the tenth century at the latest and, in response to Byzantine demand, was being extended in Calabria by the mid-eleventh century. By the thirteenth century, it was also practiced on a small scale in other southern regions as well as in central Italy, where climatic conditions were less favorable and the silk was of rather poor and uneven quality. Local silk was used in the domestic weaving of nonfigured pieces of small size, such as belts, veils, head scarves, and pillowcases, mostly made of low-grade floss silk or silk mixed with other fibers and woven on simple narrow looms, as in Venice, Genoa and southern Italy. The production of larger, medium-grade silks was restricted to Muslim Sicily, which exported them to Egypt by the eleventh century. In 1147, King Roger II of Sicily forcibly transferred to Palermo Greek and Jewish silk workers from Thebes and Corinth, cities which he had briefly occupied, in order to raise the quality of fabrics manufactured in his royal workshop. However, there was no corresponding progress elsewhere in the kingdom. The Norman rulers in the twelfth century and Emperor Frederick II in the first half of the thirteenth century were more interested in the revenue accruing from the export of raw silk and certain dyes, furthered by the rise of Italian silk centers, than in the promotion of the silk industry in their realm.

The growing demand for silks in the west was not satisfied by

imported fabrics, whether in volume or variety or in view of their prices. These circumstances enabled the establishment of a silk industry in Italy producing high-grade fabrics and capable of competing with foreign textiles in Italy itself or abroad, Lucca was the first new silk center to emerge in the west, and it retained its leading role until the early fourteenth century. It was followed by Venice in the early thirteenth century and by some minor centers such as Milan, Modena, and Bologna somewhat later. The first stage in the development of silk manufacture in the two main centers was apparently based on a core of domestic silk workers, who were joined by skilled foreign weavers using more advanced silk implements and technology. The introduction of sophisticated draw-loom with figure-harness devices allowed the weaving of intricate and ornate figure designs. At a later stage, imitations and the migration of workers became important factors in the diffusion of silk technology and weaves.

Large-scale production, especially of high-quality fabrics, depended entirely on a steady provisioning of workshops in raw materials, ensured by the extensive trade and shipping networks of Genoa and Venice. In the twelfth century, silk first came from southern Italy and Sicily; raw material from the crusader states of the Levant and Central Asia was later added. The territorial fragmentation of Byzantium in the early thirteenth century, in the wake of the Fourth Crusade, allowed the purchase of silk in Greece, the Aegean islands, and Asia Minor. The extension of the Mongols' rule over Asia promoted a flow of high-grade silk from Cilician Armenia and central Asia, as well as a flow of Chinese silk, which reached the Mediterranean for a whole century after the 1250s. An increasing volume of silk was imported from the Black Sea after the 1260s, the highest grades originating in the Caucasus and the regions bordering the southern Caspian Sea. The most precious dyestuffs utilized in Italian silk manufacture were kermes used for red, mainly imported from Greece and Asia Minor; and indigo for blue, brought over from Iraq and Cyprus.

Italy borrowed its earliest terminology for silk and its earliest types of silk from Byzantium. The two main silk centers, Lucca and Venice, produced Byzantine samites, sendals, and gold brocades; but within a fairly short period they diversified their production under the influence of eastern or Spanish fabrics. In addition, they devised new types of

textiles. By the early thirteenth century, Lucca was exporting high-grade pieces to Christian Spain; somewhat later, it was exporting to areas extending from London in the west to Byzantine Asia Minor in the east. Around the mid-thirteenth century, Venice began to manufacture high-grade half-silks—of silk mixed with other fibers—, both plain and figured, in order to compete with the luxury textiles of Lucca. Since they were cheaper, they indeed enjoyed a broader diffusion in the highly competitive silk market and were imitated somewhat later in Lucca itself, to the extent that it was sometimes difficult to discern between Venetian and Lucchese products. By 1300, Venice was exporting its fabrics as far as Spain and England in the West and Alexandria in the East. The products of both Venice and Lucca are well represented in the papal inventories of 1295 and 1311.

Italy continued to import fabrics from Greece, Spain, and especially the Levant, despite the indigenous production of high-grade silks. In the later thirteenth century, Spanish textiles with Moorish geometrical or arabesque-like patterns and varieties of so-called "tartar" silk fabrics produced in a region extending from the Near East to central Asia became increasingly popular in Italy. In the following period, Italian workshops produced luxury fabrics imitating their designs or incorporating new patterns based on Chinese and Islamic textiles. Fourteenth-century Italian silks display an amazing variety of animal and vegetable motifs within intricate patterns. Giotto, Paolo Veneziano, Bernardo Daddi, and other painters depicted such silks, some of which included Oriental inscriptions or imitations of such inscriptions—a clear testimony to the great favor they enjoyed in Italy. These paintings offer fairly accurate clues for dating various types of fabrics. Interestingly, the acquaintance of Islamic workshops with Italian textiles of that period led to the incorporation of some of their motifs into the decoration of "tartar" silks. These processes clearly illustrate an interaction between the economics of silk and the artistic aspects of silk manufacture. Sumptuous gold brocaded velvet garments adorned with pomegranate motifs in various compositional patterns and colors, some depicted by Piero della Francesca, became highly fashionable in the fifteenth century. A fairly large number of pieces belonging to the silk types just mentioned have survived.

The regulations for silk weaving issued in Lucca in 1376 reflect the

wide variety and qualities of figured and nonfigured textiles manufactured in fourteenth-century Italy. These ranged from very light fabrics to heavy brocades and included lampas weaves. One should add the low-grade small pieces mentioned earlier, the domestic production of which continued outside the framework of silk guilds strictly controlled by the urban authorities. These silks, which answered the demand of modest households, have generally escaped scholarly attention, which is almost exclusively focused on elaborate and costly fabrics.

Italy may be credited with two important technical innovations in western silk manufacture. The production of velvet in Lucca, taken over from Persia, is first recorded in 1311 and must have begun somewhat earlier. Far more important was the invention of the silk-throwing circular machine used in the drafting, twisting, and winding onto reels of silk fibers to produce strong yarn. This machine was a revolutionary technological innovation that offered substantial savings in manpower and lowered the cost of production. Contrary to common belief, it is first attested to at Lucca in 1330 and somewhat later at Venice and Bologna, where it appeared in a water-powered version which for a long time did not entirely displace the man-powered device. The diffusion of the machine was apparently connected with the migration of Lucchese silk entrepreneurs and craftsmen caused by the political turmoil in Lucca, which reached its climax in 1314.

This migration signaled the beginning of Lucca's decline as the major silk center of Italy. The Lucchese settled mainly in Venice, Bologna, and Florence, which benefited from their technical expertise and their distribution network in the west, enhancing the growth of their respective production of silk textiles. These major centers were joined in the second half of the fifteenth century by Milan, Naples, and Genoa, as well as by minor centers in northern and central Italy. By that time, Italian sericulture had been substantially extended and provided a portion of the raw materials absorbed by the silk workshops, although Italy remained largely dependent on imports. The growing diffusion of Italian silks in the west and throughout the eastern Mediterranean, including the Islamic east, which began in the thirteenth century, was not due only to the variety and quality of their weaves, the rich designs of figured pieces, or competitive prices. It was also a result of efficient

distribution within the broader framework of Italian commercial exchanges with foreign countries. These were the main factors that enabled Italy to maintain its supremacy in western silk manufacture and trade until the sixteenth century.

Simony

In the most general sense, simony is the buying and selling of spiritual things. The word derives from Simon the Magician (Magos), who was condemned by the apostle Peter for attempting to buy the power to confer the Holy Spirit (Acts 8:18-24). In the eleventh century, the seller in a simoniacal transaction was often compared to Giezi (2 Kings 5:1–27), the servant of the prophet Elisha, who demanded payment for a cure worked by his master. The *sin* of simony occurred when anyone intended to purchase a spiritual thing; the *crime* of simony occurred when an actual pact to purchase was made.

When Christianity became the state religion of the Roman empire in the fourth century, its prosperity made its offices and clerical grades worth buying. The Christian churches became important landholders, and the clergy became a privileged group, with significant exemptions from taxes and forced labor. The first form of simony to be condemned was the purchase of church offices and holy orders (Council of Chalcedon, Canon 2.451). Between the sixth and tenth centuries,

prohibitions of simony were widely ignored; it became customary for holy orders and church offices at every level to be given in return for some payment. Pope Gregory the Great formulated the classic description of forms of simoniacal payment: *munus a manu* ("gift from the hand") was the transfer of an object of value, *munus a lingua* ("gift from the tongue") was flattery or influence to gain a spiritual thing, and *munus ab obsequio* ("gift from service") was the offering of service in expectation of a reward. Gregory also called simony a heresy because the buyer assumed that the Holy Spirit could be bought and sold, though in fact simony was not usually regarded as a heresy in the strict sense of the word.

The eleventh-century church reform movements, often called the investiture controversy or the Gregorian reform, vigorously attacked simony, as well as clerical marriage and the appointment of clergy by laymen. The more radical among the reformers— e.g., Cardinal Humbert of Silva Candida (d. 1061)—argued that simony made the sacrament of orders invalid and required reordination. After debate, the canonists and theologians rejected that view.

From the eleventh century on, the efforts to define, detect, and punish simony created an extensive body of canon law. The definition of simony widened to include many things, such as payment for membership in monasteries, payment for relics, and the exchange of benefices by the clergy. Indeed, medieval critics of the clergy compared almost any association of money and spiritual things to simony. The church's income depended on distinguishing legitimate payments, such as tithes, from illegitimate payments, such as arbitrary fees for sacraments. From the twelfth century on, canonists and theologians worked out theories that protected the income of the church and its clergy, while opposing the grosser forms of bribery and extortion. Although the complicated canon law of simony was largely fixed by the thirteenth century, simony in its many forms remained a serious problem in church life until early modern times.

Sirventese

The *sirventese* (or *serventese*) is a poetic form that was first used by the Provençal troubadors, such as Peire Cardinal, Marcabru, Bertran de Born, and Folquet de Marselha. Among the Italian poets who wrote *sirventesi* are Ruggieri Apugliese, Guittone d'Ar-izzo, Chiaro Davanzati, Antonio Pucci, and Simone Serdini. The root word, *sirven*, may refer to the servant who praised the *gestes* of his lord. Another interpretation, however, is that it refers to the ancillary role of music that accompanied the recitation of the poem. Whatever its origin, the *sirventese* deals with military and political themes, as in *Serventese romagnolo* and in *Serventese dei Lambertazzi e dei Geremei*, which recounts the struggle between the Guelf and Ghibelline factions in Faenza between 1274 and 1280. Works in this poetic form also dealt with religion and didactic themes. According to Da Tempo (1977, lviii-lxi), there are three types: *simplex cruciatus* (consisting of alternating rhymes of quatrains or tercets, ababcdcd); *duplex et duatus* (consisting

of rhyming distichs, aabb or aaabbb); and *caudatus* (consisting of two or three hendecasyllables and a coda, which was usually a *quinario* that rhymed with the next stanza). In *Vita nuova* (6.2), Dante mentions that he has composed an epistle in the form of a *serventese* (*una pistola sotto forma di serventese*) about the sixty most beautiful women of Florence. Unfortunately, his poem has been lost.

Slavery

The institution of slavery in medieval Italy was an extremely complex sociological system that varied in nature from century to century and region to region. What is more, the meanings of the very terms that are typically associated with it—such as *servus*, *sclavus*, or *serf*—are often ambiguously applied by both medieval and modern writers to widely divergent social conditions. Consequently, it is difficult to understand slavery fully without considering the phenomenon from a variety of historical, juridical, and theoretical perspectives.

The slave was any individua, who was subjected to ownership by another. This relationship, ssentially inherited in the early Middle Ages from Roman law, was not much modified by early Christianity, On the whole, the church fathers adopted positions similar to those of the Roman Stoics who believed that some people were simply destined by nature to be subservient to others. Although slavery itself was against divine law insofar as all men were equal before God, most theologians made an exception in deference to state law. It was thought that, since heaven could not possibly be created on earth and therefore life was fundamentally "defective," slavery was permissible because no claim was made on the soul of the slave. In other words, only the body was enslaved, while the soul remained free to seek God's kingdom. Slavery was thought to stem ultimately from two sources: men were slaves either by nature, because they lacked moral or intellectual maturity; or by convention, if they had been captured in war. In the sixth century, Isidore of Seville, elaborating an argument originally put forth by Seneca, attributed the existence of slavery to humankind's fall from grace. These rationalizations were frequently cited together with Paul's admonition to slaves to obey their masters (Colossians 3:22) and Augustine's assertion that slavery is the natural consequence of sin (*City of God*, 19), and they contributed to the fostering of institutions such as slavery and coercive authority of other types through the early 1200s.

In fifth-century Italy, following the invasions of the Visigoths, the Huns, and the Vandals, the number of men, women, and children who fell under the yoke of forced servitude grew rapidly. This surplus drastically reduced the price of slaves and, for the first time since the days of imperial Rome, made it possible for even relatively impoverished freedmen and soldiers to own several. By this time,

however, slavery was essentially a rural phenomenon and evolved in relation to the need for manual labor in agricultural areas. In addition to bringing slaves from northern and eastern Europe, the Germanic invasions also disrupted the functioning of large agricultural estates known as *latifundia* on which large gangs of slaves were the prime source of manual labor. This plantation system thrived in southern Italy well into the ninth century but began to be replaced in the north by the distribution of smaller plots, known as *mansi*, c. 700. These plots of arable land still belonged to the landowner but were cultivated by slaves who were also called *mansi*, or *casati*.

The life of a slave was characterized by incessant hardships. In the eyes of the law, he was considered to be no more than a tool with the power of speech (*instrumentum vocale*). As his body was the property of his master, he could be bought and sold at any time and could even be executed if implicated in a crime perpetrated by his master or overseer. For minor offenses, the slave was typically flogged, and for more serious acts he would be stoned. Female slaves who committed unlawful acts risked being burned alive. Marriages between slaves were not respected by the judicial system and were considered to be simple concubinage (*contubernium*) at best. Indeed, the existence of a "wife" or child presented no impediment to transferring a slave to another *mansus*; nor did it impede his sale to another master or even to a half-free peasant. Slaves belonging to the church fared no better. Like landowners, the administrators of church properties, generally bishops and abbots, maintained groups of slaves assigned to plots of land and held the right to inherit all personal effects (*peculium*) on their death.

The assignment of slaves to a particular plot of land represented a significant step in the evolution of slavery in the Middle Ages. As opposed to the slave gangs who worked together on various holdings, individuals who were dependent on their own plot of land for the majority of their sustenance tended to be much more productive workers of the land. For the landowner, this was clearly an advantageous solution to the problems related to the housing and upkeep of large bands of workers, and it increased the productivity of farmland. Once the *casati* were established on plots, however, they began to be seen, especially in the Po valley and the farmland in the south, as competition for (and a less attractive alternative than) free

peasants; these peasants could be hired and, working for personal gain, tended to be even more efficient in the tasks traditionally related to farming as well as mining, quarrying, and forestry. Theoretically, the church considered manumission—the official freeing of slaves—a charitable act; but in reality it was due more to this competition than to moral rectitude that the number of slaves began to decline in the ninth and tenth centuries. This is not to say that slaveholders were indifferent to the religious benefits of manumission; rather, they used it shrewdly to reduce their economic liabilities while performing a pious deed. In this way, many slaves achieved a certain measure of freedom from masters who were on their deathbeds.

Two main types of freedom could be granted to slaves: *manumissio cum obsequio* (manumission with obedience) and *manumissio sine obsequio* (manumission without obedience). The former was significantly more common than the latter. When a slave was freed "with obedience" his social status changed from *casatus* to *colonus* or *servus glebae*. In other words, he received certain privileges previously denied him, but was still legally bound to his master's land as a sort of indentured servant. Therefore, while the number of slaves continued to decline, there really was very little consequence in terms of the size and composition of the landowner's workforce. In tenth-century Brescia, for example, the ratio of slaves to serfs was about 1:6. This transition gradually eroded the competitive advantages of the free peasant workforce and, on a social level, even undermined what little superiority the free peasants had enjoyed, because the upper classes made less and less distinction between the traditional slave and the poor peasant. The indentured farmer, furthermore, was subject to taxation, rent, and conscription. To make matters worse, free tenant farmers often became legally bound to their landlord after extended periods of work on his property. Occasionally, the *servi glebae* would, through hard work or good fortune, succeed in obtaining complete legal autonomy, but these cases were rare. The often ambiguous status of peasants and the working poor at the turn of the millennium has tempted some scholars to classify all landless workers as indentured servants and others to minimize the influence of slavery as a social institution. The true nature of these marginalized groups was probably somewhere in between these positions, depending on the specific

regions and political climates in which they found themselves.

The reduced need for rural slave labor did not extinguish the desire for slaves. The burgeoning economies of Italy and the tendency toward urbanization at this time still demanded human resources. While fewer slaves labored in the fields (mostly in Sardinia), more and more were put to work in other sectors of society as domestic servants, concubines, or the drudges of artisans, small workshops, and merchants. This shortage of human resources coincided with the opening of Italy to the east, accentuated in the eleventh century by the crusades. As a result of the Italians' effort in the Levant, the control of certain areas such as Acre, Beirut, and Tyre was given to Italian cities whose representatives established principalities used for commercial activity. During this time, the major port cities, such as Genoa, Pisa, Bari, and Venice, significantly increased their trade with the Muslim cities of the Mediterranean and the trading centers of the Black Sea. Among the items brought back to Italy by merchants were, of course, the slaves needed in urban centers. Indeed, despite prohibitions by the church, slaves were not only an import but also an export, as the supply continued to flow southward from the Viking possessions in Ireland and Flanders. Pope Clement V expressly denounced the sale of slaves to Egypt in 1311 when the Mameluke armies were conscripting slaves for their defense of the Holy Land. Similar prohibitions were proclaimed in 1317, 1323, 1329, and 1338. Trade with these distant lands provided the majority of human merchandise in all of the Italian peninsula except those areas dominated by the Normans, who still relied in part on the enslavement of defeated cities for their domestic slaves as well as for agricultural purposes such as the production of sugar in Palermo. At about this time, the generic Latin terms *servus* and *ancilla* were replaced in legal and personal documents by *sclavus* or *schiaivo*, which, like the English word "slave," comes from the word meaning Slav. The great majority of slaves in northern Italy, especially those sold by the Venetians, came from Russia, Poland, and the Balkans. In fact, it was not uncommon to find in inventories and bills of sale references to slaves with "yellow skin" and "almond eyes," a fact which suggests that the slave routes stretched far into the east. In southern Italy, many of the slaves were acquired not only through trade but also as one of numerous fruits of piracy. These were generally Saracens, who were doubly unfortunate in that the

church consistently upheld the right of Christians to own "infidels." By the second half of the twelfth century, greater numbers of Muslim and Moorish slaves began to appear in the major slaving cities. This increase remained relatively slow— despite the conquest of Valencia by the Aragonese in the 1230s, which put a number of Moors on the market—until the Turks took Constantinople in 1453, effectively ending Italy's supply of slaves from the Black Sea region and increasing the number of slaves taken from Africa. In 1261, the Byzantines granted the Genoese exclusive rights to the Black Sea passage, previously held by the Venetians. This change dramatically influenced the source and type of the typical domestic slave, who at this time was nearly always of Slavic descent.

The scholastics upheld the theoretical positions on slavery laid out by the canonical understanding of Aristotle as expressed by Augustine. The institution was in essence a manifestation of punishment for the evils of the postlapsarian state. It was but a small cognitive step from there to the concept of the master-slave relationship as a reflection of the dichotomy between the righteous and sinners. The generalization of this concept from the individual sinner, or slave, to entire populations seemed entirely natural to theologians and jurists. Aquinas elaborated Aristotle's notion that slavery, even if devised by man, was in accordance with natural law (*Summa contra Gentiles*, 3), and he supported his position by emphasizing the obvious usefulness of slaves in society (*Summa theologiae*). Bonaventure asserted that this social institution was a reflection of divine order. Those who were more intelligent were thought to be natural masters, while those less intellectually capable but more physically robust found their logical niche in a subservient condition. This was, of course, an exceedingly convenient perception and carried with it the added advantage to slaveholders of being able to see themselves in a positive, even benevolent, light inasmuch as their power over those they owned provided a corrective to the slaves' innate tendency toward sinfulness. The apparent responsibility to serve as the spiritual guide of the slave, however, brought inherent contradictions. The introduction of non-Christian peoples into Italy was often accompanied by their baptism before sale, making the church's position on the ownership of Christians ever more problematic. This difficulty was generally shrugged off with

the repetition of stock sophisms. The conventional baptism was in fact frequently regarded as a mere formality and received little credence. Franco Sacchetti, for example, compared the validity of such conversions to the baptism of oxen and argued for a perpetual state of servitude without the possibility of becoming real Christians (*Sermoni evangelici*, 29).

Since most slaves were destined for work in urban households, slaveholders typically preferred young females under the age of twenty-three who were willing to learn or already possessed the skills most in demand: washing, weaving, cooking, caring for children, and so on. Naturally, living space in cities was scarce, and slaves resided with the families who owned them. This physical proximity, especially in contrast to the living arrangements of rural slaves, increased the contact between male members of households and the female slaves. In Genoa, for example, domestic concubinage was apparently widespread and led not only to the birth of children but also, though infrequently, to marriage as well. Fortunately for scholars, Italy provides the most complete historical evidence for unions of this kind, and studies of the phenomenon are often quite detailed. A child born to a slave mother could either be raised as a slave or given over to a church, which would then be legally declared its "father." Only rarely do we find evidence that a mother was granted freedom in order to marry. Should the father of the child not be the slave's owner, the law decreed that he pay damages not to the woman he had impregnated but to her owner. Unwanted pregnancies and undue attention from husbands, brothers, and sons often complicated the relationships in households. Not surprisingly, it was common for a certain degree of animosity to exist between female slaves and the women of the family that owned them. The lives of young female slaves must have been quite difficult. By law, all members of the slave owner's family had the right to give them orders and to beat them should they misbehave. This privilege was extended not only to adult family members but also to the older children. Accounts of unlawful violence against slaves, and occasionally against masters, survive in juridical records from all of Italy.

The advent of the black death in the mid-fourteenth century drastically influenced the system of slavery. The vast reduction of the population made it easier for surviving servants to find more desirable

employment, often in artisan workshops and other areas not related to the daily operation of the households of the nobles. This led to a shortage of domestic servants. Although the plague had reduced the numbers of slaveholders as well as slaves, the consolidation of inheritances and the eventual reinvigoration of the economies of the city-states aggravated the shortage of labor and brought a relative augmentation of disposable income for those who survived. Those who could afford to do so replenished their supply of labor by increasing the number of slaves. This practice was not limited to private homes; indeed, anyone in need of workers, including shopkeepers, artisans, and priests, could purchase slaves. In 1363, Florence eliminated all restrictions on the importation of non-Christian slaves. Venice, however, prohibited public auctions three years later, preferring to limit new slave purchases to what it called *anime*, young Christians sold into slavery by their parents principally in Albania, Dalmatia, and some of the Greek islands. After ten years of what was called "apprenticeship," these young people were to be given their freedom. A similar system was adopted in southern Italy for a time, but it was later abandoned during the reign of the Aragonese.

The enfranchisement of slaves was on the whole less complicated during the later Middle Ages than it had been centuries earlier. Nevertheless, newly freed slaves normally owned very little personal property and often found the stigma of their social status an obstacle to successful assimilation into the society of free laborers, despite the fact that they obtained the right to possess property and participate in legal transactions. Many freed female slaves were forced by a lack of better options to become prostitutes, and many of the male slaves joined bands of brigands in rural areas. Occasionally, a slave would enjoy a restricted form of patronage from his or her master after the official ceremony of enfranchisement, especially after a long life of devoted service, but there is little evidence that this was particularly common. The ancient custom of giving slaves partial freedom, *manumissio cum obsequio*, was renewed in *manumissio cum conditione*, which continued to exist into the fourteenth century. *Manumissio cum conditione* was decidedly more generous than the older type of limited freedom and generally lasted for a shorter time, anywhere from the time it took to nurse a baby to five or six years. After this period, full liberty was

granted. Slaveholders could atone for a good number of sins through the freeing of slaves, but they could also impose grave punishments on slaves who ran away. Fugitive slaves were considered thieves under the law, because they had illegally dispossessed the master of his property. Citizens had the civic duty, according to Justinian law, to assist in the capture of runaways and to return them to the master who had suffered the loss. One clause in the truce between Pisa and Genoa in 1300 mandated that all slaves who had fled to the Pisan territory of Sardinia be immediately sent back to Genoa. Decrees in Florence in 1363 allowed for considerable fines to be levied against anyone who assisted a slave to escape or conceal himself. Sanctuary for runaways was theoretically provided in churches, from which they could not be taken by force; but in practice this proved to be simply a postponement of their inevitable recapture and punishment. The only exception was the case of a Christian slave attempting to escape from a Jewish master, but even then the doubtful authenticity of the slave's religious convictions could nullify his asylum.

Soldanieri, Niccolò

The Florentine poet Niccolò di Neri dei Soldanieri (second half of the fourteenth century) was a member of an ancient, aristocratic, Ghibelline family. His extant poems constitute one of the largest bodies of poetic works of the period.

Little is known of Soldanieri's life. According to Carducci (1970, 1973), Soldanieri died on 21 September 1385; however, there is reason to doubt this. According to Miraglia (1947), Soldanieri may have lived in Lucca in 1380, where he would have met Giovanni Sercambi (1348–1424), author of the *Novelle* and the *Croniche*. In these works, Sercambi uses many of Soldanieri's poems in order to color his narrative. Thus, together with several codices—Rediano 184 of the Laurentian Library in Florence, Chigiano L.IV.131 of the Vatican Library, and others—the manuscripts of Sercambi's *Novelle* (Trivulziano 193 of the Biblioteca Trivulziana in Milan) and *Croniche* (Lucca 107 and Codex 266 of the state archives) are important primary sources for Soldanieri's poems.

Soldanieri treats many conventional themes in a variety of forms: madrigals, *ballate*, *cacce*, sonnets, and *canzoni*. His moralistic *canzoni* contributed significantly to his reputation during the *Trecento*. Modern readers have appreciated his shorter lyrics for their fluid and intense lyricism and lively representations of love—as did the musicians of the *ars nova* who set to music several of his madrigals, *ballate*, and *cacce*.

In his shorter lyrics, Soldanieri artfully creates images expressing complex emotions, primarily through the use of animal imagery, puns, alliteration, onomatopoeia, repetition, and dialogue. Madrigals, such as *A forniuoł vo, Come da lupo pecorella presa*, and *I'sono unpipistrel che vo gridando*, represent the poet's mixed fortunes in his pursuit of love. In

these poems, Soldanieri adeptly contrasts the expectation of love with reflection after disillusionment, as in the *congedo* of *Come da lupo pecorella presa: E quel che di tal fatto più mi scorna/è ch'io rassetto il caso e que' non torna*. Here the poet underscores both his present disappointment and his anticipated future regret.

Soldanieri makes ample use of popular language and dialogue, particularly in many of the *ballate* and the three *cacce* (*A poste messe, Chi caccia e chi è cacciato, Per un boschetto fira pungenti spine*). He was one of the first poets to use the *caccia* form, in which he combined realistic and colloquial language with lyric description.

Modern scholars describe Soldanieri as having composed *poesia per musica* (Sapegno 1973) or *poesia sentenziosa e gnomica* (Corsi 1969). Such labels do not capture the diversity and complexity of Soldanieri's poetry, which is worthy of greater critical notice than it has received.

Sonnet

In his discussion of the hierarchy of poetic forms in *De vulgari eloquentia* (2.3.5-6), Dante notes that the *canzone* is the most noble, followed by the *ballata*, which is in turn followed by the sonnet. Moreover, he says (2.4.1) that these "inferior" forms will be treated in the fourth book of his treatise, where the "middle level of the vernacular" will be discussed (*in quarto huius operis, cum de mediocri vulgari tractabimus*). This fourth book was never written, and thus we may only speculate about Dante's reluctance to consider the sonnet as a noble metrical form. Perhaps his reasons had to do with the brevity of the form, or with the fact that it had become a very popular vehicle for the expression of all sorts of arguments in the course of the thirteenth century. The disposition of poems in the early manuscripts of Italian verse follows this generic hierarchy, with *canzoni* being presented first, then *ballate*, and finally sonnets. Such is the case in the largest of these collections, Vatican Codex Lat. 3793, as well as the codex Rediano 9 in the Laurentian Library in Florence and Banco Rari 217 (formerly Palatino 418) in the National Library in Florence.

The sonnet was probably invented by Giacomo da Lentini, a notary attached to the imperial court of Frederick II Hohenstaufen in Sicily. Various attempts have been made to trace the origin of this fourteen-line composition: it may have resulted from a fusion of two *strambotti* (eight-line popular poems in *endecasillabi* in alternating rhyme with a curtailing of the second to six verses); it may represent an attempt to achieve mathematical perfection in terms of Pythagorean harmonies; it may have resulted from imitation of the *canzone* strophe; or it may simply have been invented by Giacomo. In any case, its basic fourteen-line form was fixed from the beginning as a bipartite composition

consisting of an octave in alternating rhyme ABABABAB and a sestet in a variety of schemes (CDCDCD and CDECDE are the most common), all *endecasillabi*. Later on, in the thirteenth century, a new form for the octave was invented by Guittone d'Arezzo—ABBAABBA—and this became the preferred pattern. Numerous rhyme schemes were devised for the sestet—CDEEDC, CDCCDC, CDEDCE, and so on. What emerges is a sense of versatility and flexibility within the artificial restrictions of the fourteen-line composition. Indeed, this short metrical form provided a sort of proving ground for poets, who were eager to test their own poetic abilities within these limits. One case in point is Guido Cavalcanti's sonnet *L'anima mia vilment'è sbigotita*, which has the intentionally asymmetrical rhyme scheme ABBBBAAA CDDCC, standing as the metrical counterpart to the lover's emotional disequilibrium. Without relying on fragmented syntax or harsh language, Cavalcanti is able to convey the sense of imbalance through subtle manipulation of the rhyme scheme, which is unique among the many sonnets written in the thirteenth and fourteenth centuries.

Early on, the sonnet became the vehicle for poetic correspondence in *tenzoni*, in which one poet would write a sonnet on a particular topic (generally on love, but also on moral issues) and send it to another poet, asking for his views on the subject. The addressee would then respond, generally *per le rime*, i.e., using the same rhymes and rhyme scheme as those in the original sonnet. In addition to this epistolary use, the sonnet also became the basic strophic unit in sonnet cycles (known as *corone di sonetti*), which were composed on such subjects as the days of the week and the months of the year (e.g., by Folgore da San Gimignano) and on longer narratives (e.g., *Il Fiore*, attributed to Dante, presents a greatly abbreviated version of the Old French *Roman de la Rose* in 232 sonnets).

In the first century or so of its existence, the sonnet underwent most of its formal transformations at the hands of adventuresome poets who altered and expanded in various ways the seemingly rigid fourteen-line structure. For example, *sonetti caudati* ('tailed' sonnets) have additional verses (one, two, or three) tacked on at the end: e.g., ABBA ABBA CDC DCD D or ABBA ABBA CDC DCD EE. Invented by Puccianzone Martelli (*Signer senza pietansa, udit'ho dire*), the *sonetto doppio* ("double sonnet") consists of twenty verses with *settanari* added

after verses 1, 3, 5, and 7 of the octave and after verses 10 and 12 of the sestet: e.g., AaBAaB AaBAaB CDdE CdDE. The *sonetto doppio caudato* ("double tailed" sonnet) follows the form of the *sonetto doppio* with the addition of extra verses forming the "tail": e.g., AaBBbA AaBBbA CdDD DdDC EE. Guittone d'Arezzo invented the *sonetto rinterzato* (e.g., *O benigna, o dolce, o graziosa*), which is very similar to the *sonetto doppio*, except that its twenty-two verses have an additional two *settenari* in the sestet: e.g., AaBAaB AaBAaB CcDdC DdCcD (thus giving greater emphasis to a rhyme by repeating it in the *terzine*, the sestet). Finally, the *sonetto raddoppiato* ("redoubled" sonnet, invented by Maestro Francesco) is true to its name in that it has twenty-eight verses, twice the number of the "normal" sonnet: e.g., ABAB ABAB ABAB ABAB CDE CDE FGH FGH (or CDCDCD EFEFEF). Another variation on the basic sonnet form was invented by Guittone d'Arezzo but was brought to perfection by the Florentine Monte Andrea; this is the sixteen-verse sonnet, with a ten line first part: e.g., ABABABABAB CDCDCD.

Perhaps because of its brevity and versatility, the sonnet became the most popular metrical form in the thirteenth and fourteenth centuries. Guittone d'Arezzo composed 250 sonnets on a wide variety of topics. Dante wrote 291 sonnets (including the 232 sonnets that form the elaborate series of *Il Fiore*). Of the remaining fifty-nine of Dante's sonnets, twenty-five are contained in *Vita nuova* and assume special importance and meaning because of their integral position in that work. Approximately one-fourth (fourteen) of these fifty-nine sonnets are part of *ten-zoni* with other poets and thus lose a certain degree of spontaneity and freedom of expression, and the same could be said about the sonnet production of other thirteenth-century poets. The popularity of this metrical form may be demonstrated by the number of sonnets composed by the following poets: Chiaro Davanzati, 122; Dante da Maiano, forty-eight; Monte Andrea, 112; Guido Guinizzelli, fifteen; Guido Cavalcanti, thirty-six; Cino da Pistoia, 134; Cecco Angiolieri, 112; Rustico Filippi, fifty-eight; Cecco Nuccoli, twenty-nine; Marino Ceccoli, twenty-five; Neri Moscoli, 111; Niccolò dei Rossi, 436; Antonio Beccari, forty-four; Francesco di Vannozzo, 153; Franco Sacchetti, 135; and Francesco Petrarca, 317 (in the *Canzoniere*). For Dante and for other poets in the *Duecento* and *Trecento*, the sonnet represented an ideal

initial proving ground, before they embarked on other poetic endeavors.

Sordello

The troubadour Sordello (Sordel, 1225—1269) was born in Goito, near Mantua, and belonged to the lower aristocracy. He left forty-two poems and *Ensenhamen d'onor*, a work teaching the rules of high moral standards, especially of honor. After his famous *planh*, his *tensos* are his best poems: vibrant and impetuous, they bear witness to a proud mind and original talent. Sordello's eloquence was admired by Dante in *De vulgari eloquentia* (1.15.2).

Early in his life, Sordello was active as a troubadour in the small courts of the Veneto, but he had to flee rather ignominiously after seducing, abducting, and abandoning the wife of the count of Sambonifacio. He then went to Spain and perhaps even to Portugal. Disappointed in the court of the king of Aragon, he returned to France and finally established residence in Aix at the court of Raimond Berenger V, count of Provence, where he earned fame and honor. Here he met the troubadour Blacatz, lord of Aups, near Draguignan in the Var valley (c. 1190—1237), with whom he became friends and to whose

memory he dedicated a *planh* (elegy) that is one of the most renowned works of medieval Occitan literature. In this poem, he used the old mythical image of the "eaten heart" in a virulent attack on the politicians of his time, urging them to eat of Blacatz's heart in order to acquire some of his qualities. It was this *planh* that impressed Dante, who chose Sordello to guide Virgil and himself in Cantos 6-8 of *Purgatorio*.

In 1246, Charles of Anjou succeeded his father-in-law as count of Provence. Sordello accompanied Charles's army in 1265, but in 1266 he was inexplicably a prisoner in Novara; Pope Clement IV intervened personally to obtain his freedom. In 1269, Charles endowed Sordello with the lordship of several castles in the Abruzzi, where he died the same year, perhaps by violence.

Spinello Aretino

The painter Spinello Aretino (Spinello di Luca Spinelli, c. 1350— 1410) was born into a family of goldsmiths. Spinello was active in the principal towns of Tuscany, and his art, like that of his contemporaries Agnolo Gaddi and Antonio Veneziano, is characterized by profound insight into Giottesque concerns with light, space, and form. To this should be added his highly expressive treatment of line and, in certain works, an interest in richly wrought surface textures and luminous color. His skills in narrative composition and design were cleverly applied in the many important monumental fresco commissions that punctuate his career.

1370s-1385: Arezzo and Lucca

It would appear that Spinello spent his formative years in Arezzo, and it is likely that he trained under the local painter Andrea di Nerio, whose influence can be detected in the austere and powerfully modeled forms of Spinello's fresco *Virgin and Child with Saints and a Donor* (1377; Arezzo, Museo Diocesano). By the early 1380s, Spinello had moved to Lucca, where the measured style of his earlier Aretine phase had evolved to take greater account of the decorative qualities of line and color; these developments suggest that he was responding to the sumptuous aspects of contemporary Lucchese artistic culture, especially the art of Angelo Puccinelli. In 1384, it is documented that Spinello had recently executed an altarpiece for the Olivetan order in Lucca; today, its principal components are generally identified as a central *Virgin and Child with Angels* (Fogg Collection, Cambridge, Massachusetts), two flanking panels of *Saint Pontianus* and *Saint Benedict* (both in the Hermitage, Saint Petersburg), and three predella scenes (Galleria Nazionale, Parma). The pre-della scenes were designed with a remarkable degree of spirited narrative detail, and some of the motifs indicate that Spinello was familiar with the monumental fresco cycles of the Campo-santo in nearby Pisa. Spinello's sojourn in Lucca culminated in another commission from the Olivetan order: a grand

polyptych for the high altar of Santa Maria Nuova in Rome. Its central panel (now missing) was signed and dated 1385.

1386-1398: Arezzo, Florence, and Pisa

Spinello is documented in Arezzo in 1386. He was in Florence the following year, by which point he had joined the *Arte dei Medici e degli Speziali* and had received payment for two designs of statues intended for the cathedral facade. In this same period, he was commissioned by the Alberti family to work on two great fresco cycles: scenes from the *Life of Saint Benedict* (c. 1387– 1388) for the sacristy of the Olivetan foundation of San Miniato al Monte, and episodes from the *Life of Saint Catherine of Alexandria* (c. 1390) for the private chapel of the Alberti, the Oratorio di Santa Caterina in Antella (outside Florence). Spinello's powers of narrative composition, which were already evident in the pre-della scenes of the Lucchese altarpieces, are fully developed in both fresco cycles, in which the facial expressions and individual gestures of the robustly modeled figures have been intelligently selected. In these years, Spinello's use of rhythmic line intensified, as can be seen in his next project, frescoes depicting scenes from the *Lives of Saints Ephysius and Potitus* (1390-1391) in the Camposanto of Pisa. Here, Spinello emphasizes the calligraphic forms of the undulating drapery and also exhibits an interest in antique models, for his great battle scenes rely on reliefs from Roman sarcophagi for their effects. Following this commission in Pisa, Spinello returned to Florence, where he probably completed the cycle in Antella, as well as executing frescoes of episodes in the *Life of Saint John the Baptist* (now destroyed) in the Manetti Chapel in Santa Maria del Carmine. Spinello is again documented in Arezzo in 1395-1397.

1399-1411: Florence, Siena, and Arezzo

Spinello Aretino (c. 1332-1410), *Saint Benedict Receives King Totila*. Fresco from *Legends of Saint Benedict*. San Miniato al Monte, Florence. Photo: © Scala/Art Resource, N.Y.

Between 1399 and 1401, Spinello was once again working in Florence, where he collaborated with Niccolò di Pietro Gerini and Lorenzo di Niccolò on the high altarpiece of Santa Felicita (1401; Accademia, Florence). Spinello's austere saints from the right wing are in marked contrast to his dancing angels in the central panel, whose furious movements and fully activated drapery forms are remarkable for their expressive force. In the following years Spinello was mostly occupied with commissions in Arezzo, but by late 1404 he was in Siena to paint frescoes for the Sant'Ansano Chapel (now destroyed) in the cathedral. His years in Siena culminated in a commission, on which his son Parri Spinelli assisted him, to decorate the Sala di Balia in the Palazzo Pubblico with frescoed scenes from the *Life of Pope Alexander III* (1407-1408); these are remarkable for their engaging anecdotal elements and expressively characterized human figures.

Spinello occupies an important position in the development of Tuscan painting. His interest in the principles of Giotto's art and his competence in monumental mural painting were to influence Masaccio and others; at the same time, his lavish effects of color and pattern, decorative use of line, and freshness of narrative anticipated the late

Gothic style of Lorenzo Monaco and Lorenzo Ghiberti.

Spinola Family

The noble Spinola family—descended from the viscounts of Manesseno, who wielded power in Genoa on behalf of the Marchese family Obertenghi—was among the four most important families of medieval Genoa. The head of the line was Guido Spinola, who took part in the

Genoese expedition to the Holy Land during the First Crusade. Thereafter, from the beginning of the twelfth century up to the 1120s, Guido held the consulship three times in the *compagna*, which formed the nucleus of the later commune. The family name Spinola goes back to him. A great number of family members served the commune as consuls in the twelfth century and at the beginning of the thirteenth century; furthermore, we find them in the sources as commanders and ambassadors in service to Genoa.

The extension of the family's property in the city—from the *borgo* quarter to the hill of Luccoli—led to a division of the family into two branches, named for the places where they lived: the Spinola of San Luca and the Spinola of Luccoli. In the Scrivia valley, the Luccoli branch of the family held imperial fiefs, which were confirmed by Emperor Henry VII on 15 July 1313.

In the thirteenth century, the history of the family corresponds with the history of Genoa. We find the Spinola together with the Doria family at the head of the Ghibelline faction and much involved in civil strife within the city. This led to a "dyar-chy" of the two Ghibelline families in the city in the second half of the thirteenth century: one member each from the Spinola and Doria families formed pairs who, from that time, dominated the government, a situation occasionally interrupted by the rule of a *podestà*. In 1270, the nobles chose Oberto Doria and Oberto Spinola to serve together as captains of the people (*capitanei comunis et populi*). During their government, the Genoese fleet defeated the Pisan fleet in the battle of Meloria (August 1284), which marked the beginning of Genoese supremacy over Corsica and Sardinia and established Genoa as a Mediterranean power.

The civil war at the beginning of the fourteenth century brought chaos to Genoa and caused several changes in political regimes. In 1309, Opicino Spinola of Luccoli tried, but failed, to establish a *signoria* in Genoa. He was exiled until 1311. The civil war in Genoa lasted until 1331, when peace was made between the Ghibellines and Guelfs. The subsequent captaincy of Raffaele Doria and Galeotto Spinola ended with the revolt of the *popolo* in 1339. Simone Boccanegra was elected doge, and all nobles were excluded from the highest communal offices. The Spinola took part in new revolts against the commune, operating from their rich possessions in the Apennines and in the Oltregiogo. In

1378, however, they allied themselves with the commune and were again allowed to take part in the government, as *anziani* (elders). Members of the Spinola also turned up as ambassadors and admirals in the late fourteenth century. For instance, Gaspare Spinola of Luccoli negotiated with the king of Hungary and served as commander-in-chief in the war of Chioggia.

Spoleto

Spoleto is a city in Umbria about 75 miles (120 kilometers) northeast of Rome on the Via Flaminia. It was settled as early as the seventh century B.C. and became a Roman colony in 241 B.C. It was an important urban center in the late republican and imperial periods.

Like many Italian cities, Spoleto suffered a sharp decline in

population in the fifth and sixth centuries after Christ, especially when it was captured by the Ostrogothic king Totila in 545. In the late sixth and seventh centuries, the Lombards made Spoleto the seat of a semi-independent duchy. It remained the chief residence of the Lombard dukes and later the Frankish dukes of Spoleto through the twelfth century. Many of the important churches in and around Spoleto were first built during this period, often with ducal patronage. Spoleto probably organized itself as a commune in the early twelfth century, but the first documented reference to a commune comes in 1173.

Spoleto was sacked by the emperor Frederick I Barbarossa in 1150, after the commune had refused to pay the customary *fodrum*, or hospitality tax. This began more than 200 years of conflict in Spoleto between imperial and papal political factions whose local manifestations were usually referred to as Ghibellines and Guelfs, respectively. Spoleto was generally a Guelf commune, despite periods in which it was under the control of imperial officials. The imperial duke from 1177 on, Conrad of Urslingen, withdrew from Italy and submitted the duchy to the papacy in 1198. Pope Innocent III personally received the homage of the Umbrian communes, including Spoleto.

Innocent III and subsequent popes struggled to establish and maintain firm control over the duchy of Spoleto, against both the desire of the communes for independence and the increasing pressure from the imperial forces of Frederick II. The formation in 1237 of a Guelf league of communes, headed by Perugia, brought down the emperor's wrath, and troops, onto Umbria. Frederick II captured Spoleto in 1241 but was unable to establish uncontested authority. The papacy attempted to bring Spoleto back to its side through a grant of generous privileges. Cardinal Ranieri's grant of 1247 tried to buy Spoleto's loyalty through such provisions as giving the commune the right to have its own statutes. The existing Spoletan statutes, *Breve populi*, however, date to 1296.

After Frederick's death in 1250, and through the rest of the thirteenth century, the papacy was in control of the patrimony, including the duchy, but tension persisted between Spoleto and the papal rectors. As the papacy tried to increase its control and its revenues, communes such as Spoleto fought against what they perceived as oppression. By the early fourteenth century, resentment against papal rule had

strengthened the Ghibelline faction in Spoleto. The Ghibellines forced the expulsion of Guelf families from the city on several occasions and welcomed the appearance of the emperor Henry VII in Italy. After Henry's death (1313), Spoleto had to make peace with its Guelf rival, Perugia, though the pro-imperial faction continued to dominate. In 1319, the Spoletan Ghibellines attacked the houses and persons of the Guelfs. Some Guelf families were able to flee, but hundreds were imprisoned and subsequently massacred. Perugia led the Guelf forces that eventually forced Spoleto to surrender in 1324. The Ghibellines were expelled, and Spoleto was subjected to Perugian control, which lasted until the 1350s.

In 1354 Cardinal Albornoz subdued the duchy of Spoleto, and a year later he took control of the city itself. At the direction of Albornoz, a massive fortress was built on Monte Elia overlooking Spoleto. This fortress—La Rocca—became the headquarters of papal administration in the duchy of Spoleto from which the rectors exercised firm control well into the early modern era.

Squarcialupi Codex

The Squarcialupi Codex, compiled between 1415 and 1419 in Florence, is one of the major manuscript sources of Italian *Tre- cento* music. Its provenance designation is Florence, Biblioteca Medicea Laurenziana, Med. Pal. 87. The miniatures can be traced to the Florentine monastery of Santa Maria degli Angeli, and the compiler was probably Paolo da Firenze. The manuscript was owned in the fifteenth century by Antonio Squarcialupi (1416–1480), who was the most famous Italian organist of his generation. He was organist at Santa Maria del Fiore in Florence from 1432 to 1480 and was closely associated with Lorenzo the Magnificent and Guillaume Dufay. The manuscript passed from Antonio to his son Francesco, who then gave it to his uncle R. Bonamici. Bonamici gave the manuscript to Giuliano de' Medici c. 1512, and from there it was given to the Biblioteca Medicea Laurenziana.

The codex itself comprises 216 parchment folios (40.5 by 28.5 centimeters, or about 16 by 11 inches), two original parchment flyleaves at the front, and five modern paper flyleaves (three at the front, two at the back). The original foliation is i—ccxvi, and the structure is eighteen gatherings of three to ten bifolia each. It may have been copied by one scribe, although two or three similar compilers have not been ruled out.

The Squarcialupi Codex is the most important Italian music manuscript of the late medieval period. Not only does it contain the only surviving music of a number of *Trecento* composers, but it also has a realistic portrait of each composer preceding his musical works. The most famous portrait is of the blind composer Francesco Landini

playing an organ. The manuscript contains 354 pieces, of which two appear twice. There are 115 madrigals, twelve *cacce*, and 227 *ballate*. The musical compositions date from 1340 to 1415 and are arranged in chronological order by composer: Giovanni da Cascia (twelve), Jacopo da Bologna (twenty-eight), Gherardello da Firenze (sixteen), Vincenzo da Rimini (six), Lorenzo da Firenze (seventeen), Donato da Cascia (fifteen), Niccolo da Perugia (thirty-six), Bartolino da Padova (thirty-seven), Francesco Landini (146), Egidius and Guglielmo de Francia (five in all), Zacar (seven), and Andreas de Florentia (twenty-nine). Sixteen folios have been left blank between Lorenzo and Donato for the music of Paolo da Firenze, and there are twenty-three folios left blank at the end of the codex for the music of Jovannes Horganista da Florentia.

Statius

Publius Papillitis Statius (c. A.D. 40 or 50-96) achieved literary success

in Rome and was admitted to the court of the emperor Domitian, whom he glorifies in his poetry.

Statius produced three extant poetic works. The *Thebaid*, published c. 91, recounts the attack of the "seven against Thebes" and the struggle between Eteocles and Polynices, sons of Oedipus, for control of the city. Although the *Thebaid* is set in a mythical past, its depictions of fraternal strife, moral crises, and a ruling family's disintegration speak to the ethical and political concerns of Statius's day. Written in hexameters and divided into twelve books, the *Thebaid* explicitly takes Virgil's *Aeneid* as its model; at its conclusion, Statius directs his epic to follow Virgil at a distance and revere his footprints. The *Silvae* is a collection of five books of occasional verse written after the year 92 in various meters. The poems offer a glimpse of the Roman society of the day, commemorating both public and private events, ranging from the emperor's achievements to the marriages and deaths of Statius's friends. Statius's last work, the *Achilleid*, was left unfinished when the poet died after having written little more than one of its projected books. Statius had intended to compose an epic rendering of the life of the Greek hero Achilles but managed to narrate only Achilles' early days.

Statius was enormously renowned in the Middle Ages. His *Thebaid* remained more or less a staple of the medieval literary diet. As a school text, it was esteemed in the Middle Ages for its representation of an unambiguous moral conflict between Olympus and the underworld and for its use of allegorical personifications. His *Achilleid*, too, was frequently copied, commented on, and imitated in the Middle Ages. It was included among the six texts of the *Liber Catonianus*, a popular medieval schoolbook used in grammar curricula, and thus reached a large readership. The *Silvae* fared less well; very few copies of the collection were available in the Middle Ages, and not until a manuscript of the poems was rediscovered in the *Quattrocento* did the *Silvae* begin to circulate again.

Dante, in the *Commedia*, makes liberal use of the *Thebaid* and alludes several times to the *Achilleid* but appears unfamiliar with the *Silvae*. Most notable, however, is Dante's treatment of Statius as a Christian character on his way to paradise. In *Purgatorio* 21, Statius, just released from his penance, encounters Dante and Virgil and accompanies them to the earthly paradise. He narrates the story of his

conversion to Christianity in *Purgatorio* 22, giving full credit for his belief in Christ to his reading of Virgil's *Fourth Eclogue*. Since there is no evidence that Statius was indeed a Christian or was considered a Christian in the Middle Ages, it appears that Dante invented the story of Statius's conversion, making use of a popular tradition that understood the *Fourth Eclogue* as a prophecy of Christ's coming.

Statius also plays a special role for Boccaccio, whose epic *Teseida* relies heavily on material in the *Thebaid*.

Stefano Protonotaro

Nothing is known about the life of the poet Stefano Protonotaro. His name is recorded as Ser Istefano di Pronto Notaio di Messina in Vatican Codex 3793 and as Istefano di Messina in manuscript Rediano 9 (Laurentian Library, Florence); the most widely adopted variant, Stefano Protonotaro da Messina, comes from the sixteenth-century Barbieri Codex. He lived toward the end of the reign of Frederick II (d. 1250) and shortly thereafter. Stefano may be identical with a Stefano di Protonotaro mentioned in a document from 1261 and again in 1301; but at least one scholar identifies him with a Stefano da Messina who translated two treatises on astronomy from Greek into Latin.

Stefano Protonotaro is the author of three *canzoni* in a refined mode.

The fame of his *canzone* *Pir meu cori alligrari* is due in no small measure to the fact that it is the only poem of the Sicilian school to have been preserved both in a Tuscanized form and in a more primitive Sicilian form, the latter version appearing in the Barbieri Codex. His poem *Assai cretti celare* is erroneously attributed to Messer Piero delle Vigne in the Lauren-tian Codex. The last of his *canzoni*, *Assai mi placeria*, is anonymous in the Vatican Codex. A noteworthy feature of Stefano's work is his predilection for animal similes, revealing a strong influence from the troubadour Rigaut de Berbezilh.

Stephen II, Pope

Pope Stephen II (d. 757, r. 752-757) is sometimes identified as Stephen III

—his predecessor, the original Stephen II, having died in 752 before being consecrated. Stephen became pope at a time of flux that gravely threatened the papacy. Since the late seventh century, the control of the Byzantine empire over its Italian possessions had steadily deteriorated. This decline allowed a succession of popes to assume de facto control over the duchy of Rome and to formulate an increasingly persuasive ideology justifying the right of the successors of Saint Peter to guide the orthodox in Italy, i.e., the true Romans who spurned the heretical iconoclastic policy of the emperors. However, another Italian power, the Lombard kingdom, was eager to exploit the decline of Byzantium. The Lombards became increasingly aggressive, and in 751 the Lombard king, Aistulf (r. 749-756), seized the exarchate, an important Byzantine territory around Ravenna, and threatened to occupy the duchy of Rome.

Stephen's central concern throughout his pontificate was to provide security for what was coming to be called the Republic of Saint Peter. After diplomacy failed to avert the Lombard threat and after approaches to Constantinople made clear that his theoretical overlord was incapable of protecting Rome, Stephen turned to Pepin III, king of the Franks. Pepin was perhaps grateful to the papacy, which had approved his seizure of the Frankish crown in 751, and indicated that he was willing to support Stephen's cause. Stephen thereupon journeyed to Francia in 753–754. After lengthy negotiations, the two parties entered a treaty of friendship, and Pepin agreed to protect the papacy and to restore to it extensive territories described in a written document. For his part, Stephen solidified the claim of the Carolingians to the throne by reanointing Pepin and his sons and by forbidding anyone to replace the Carolingians as kings. He also bestowed on Pepin and his sons the vague title *patricius Romanorum*, which implied that the Frankish rulers were responsible for protecting the Romans.

Pope Stephen II. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 163v.

These negotiations resulted in a successful Frankish expedition to Italy in 755, which exacted from Aistulf a promise to restore extensive territories. However, once Pepin left Italy, Aistulf refused to respect his promise and again threatened Rome, Stephen's appeals led to a second Frankish expedition in 756 and another defeat for Aistulf. Pepin's agents now took possession of formerly Byzantine cities and territories in the exarchate and the Pentapolis and granted them to the pope, in a document known as the Donation of Pepin. Although these territories did not encompass all that Pepin had promised in 754, they and the duchy of Rome constituted the core of what was in effect an independent papal state. Stephen II followed up this success by playing a significant role in the election of Desiderius (757-774) to succeed Aistulf under terms favorable to the papacy.

When Stephen II died, there remained many uncertainties about the exact boundaries of the papal state, the future course of action of the new Lombard king, and the relationship between the papacy and the

Frankish monarchy. However, Stephen's successes in expanding the republic of Saint Peter and in gaining a protector for it marked a turning point not only in papal and Italian history but also in the history of the west and its relationship with the east.

Flavius Stilicho (c. 350 or 365-408) was born of a Roman mother and a Vandal father. His father served under the emperor Valens (r. 364-378) as a cavalry officer. Stilicho had a distinguished career in the imperial service. His earliest known activities occurred in the 380s, when he served as a praetorian tribune on an embassy to the Persian court. He subsequently was promoted to count of the stable and married Serena, niece of the emperor Theodosius I (r. 379-395). They had a son, Eucherius; and two daughters, Maria and Thermantia, both of whom eventually married the emperor Honorius.

By the late 380s, Stilicho had become count of the domestics (a branch of the imperial bodyguard), in which capacity he probably accompanied Theodosius to Italy in a campaign against the western usurper Magnus Maximus (r. 383-388). At this time, Stilicho met the distinguished Roman senator Symmachus. He then was raised to the rank of master of soldiers, and after campaigning against the barbarians of Thrace he returned to Italy to assist in the suppression of the usurper Eugenius (392-394). In 394, Stilicho was named both supreme master of soldiers and guardian of the young western emperor Honorius. When Theodosius died early the next year, Stilicho became the *de facto* ruler of the west.

Stilicho's administration, from 395 until 408, was marked by his attempts to extend his authority over the east as well. This ambition was opposed by the advisers of the eastern emperor Arcadius (r. 383-408). On several occasions, Stilicho advanced into the Balkans and had the Visigoths at his mercy, only to be ordered by the eastern government to withdraw to Italy. Stilicho's ingrained loyalty to the dynasty, and his reluctance to cause a civil war, led him to obey.

Stilicho was able to defeat a number of barbarian invasions of Italy, such as those of the Visigoths in 402 and of Radagaisus in 406. In 407, Stilicho was faced by a revolt of the common soldier Constantine in Britain and Gaul. Early in the next year, the Goths demanded a large subsidy, which Stilicho obtained, hoping to send them to Gaul to oppose Constantine. In response to the barbarians' threats against Italy, Stilicho also repaired the walls of Rome and denuded the garrisons of Britain and Gaul.

Meanwhile, the situation was complicated by the death of Arcadius in 408. An intriguer at the western court, Olympius, took the

opportunity to circulate a rumor that Stilicho, who never could live down his barbarian ancestry, planned to set his own son Eucherius on the eastern throne. Subsequently, the Italian army mutinied, and Stilicho was arrested. Loyal to the end, Stilicho did not resist but went meekly to his execution. His son Eucherius and wife Serena soon suffered the same fate. Stilicho's death opened the way for the Visigoths' sack of Rome in 410.

Stilicho was one of a number of talented barbarians to reach high office during the later Roman empire. His regency of the western empire was a watershed. Although he was an effective administrator and general, he set in motion precedents and policies that eventually worked to the detriment of the western empire. His administration was marked by increasing antipathy between the eastern and western governments. Never again were both sections of the empire to be ruled effectively by a single person. Although Stilicho was successful in defending Italy against barbarian invasions, his stress on the defense of Italy worked to the disadvantage of other provinces, such as Gaul and Britain. And although Stilicho himself was generally effective in his delicate policy of using barbarians in the service of the empire, the practice of allowing barbarian groups a large degree of autonomy eventually would result in the establishment of independent barbarian kingdoms in the western empire.

Strambotto

A *strambotto* is a short Sicilian poetic form (eight-line stanza with strict alternating rhyme: abababab) that emerged in the thirteenth century and is viewed as a metric source from which the sonnet possibly developed. The narrative *strambotto*, for which there is no equivalent English term, generally treated the theme of love, but some *strambotti* were satirical, humorous, or religious. Early *strambotti* were probably an improvised, oral form that also served as work songs. The colloquial language of the *strambotto*, as well as its formal simplicity, indicates a popular poetic form rather than a high, aulic (courtly) form. Later, *strambotti* were composed by humanists and city-dwellers as lighthearted entertainments written in a mock-rustic vein.

The *strambotto* is distinct from other eight-line forms such as the Tuscan *rispetto* (ababccdd) and *ottava rima* (abababcc), which ended in couplets. The *strambotto* and the *rispetto* were single strophe forms, but the octave was used in longer compositions such as *cantari* and epics. The brevity and rhyme scheme of the *strambotto* made it ideal for performance with music, and in the Renaissance its production flourished in northern cities and courts. Noted practitioners included the Venetian patrician Leonardo Giustinian; Serafino Aquilano from Abruzzo, who served as a court poet and musician at Milan and Mantua; Poliziano who composed some 200 Tuscan *rispetti*; Luigi Pulci; and Lorenzo de' Medici.

Subiaco, Monasteries of

Subiaco, a commune some 40 miles (64 kilometers) east of Rome, takes its name from the artificial lakes of Nero's villa Sublacum (beneath the lake). According to Book 2 of the *Dialogues* of Pope Gregory the Great, Saint Benedict of Nursia fled to Subiaco, disillusioned by the immorality of the city of Rome, where he had been sent for study. He found at Subiaco a monk—Romanus—experienced in the monastic life, who showed him a cave in the rocks above the Anio River. Benedict lived an eremitic life in this cave (later named Sacro Speco) for three years, cared for and directed by Romanus. After preaching to the local shepherds and attempting to rule the recalcitrant monks of Vicovaro (who tried to poison him), Benedict founded twelve communities of cenobites, all under his direction. Sacro Speco and the abbey of Saint Scholastica are thought to have descended directly from Benedict's original twelve. After completing his work at Subiaco, c. 525 or 529, Benedict left for Monte Cassino.

The abbey underwent the depredations that commonly befell Italian

monasteries of this period: it was destroyed by the Lombards c. 601, and twice by the Saracens in the ninth century. During the tenth century, the monastery and especially its abbot, Leo, were favored by the popes, including John X, Leo VII, John XII, and especially Alberic II, senator and prince of the Romans. It was Alberic who transformed the small monastery of Saint Scholastica into a great abbey; subsequently, other powerful people made important donations of land and money.

In 1052, Pope Leo IX visited Subiaco to settle various disputes and to correct abuses; a similar visit was made by Pope Gregory VII (r. 1073-1085), who would create Abbot John a cardinal. The monasteries of Subiaco flourished particularly under Abbot John, who was known and revered as a learned administrator and pious monk. He made Sacro Speco the terminus of a yearly procession and had the altars of the cave reconsecrated. During John's abbacy, Pope Paschal II (r. 1099-1118) removed the abbey of Saint Scholastica from the jurisdiction of the bishop of Tivoli and made it an *abbatia nullius*.

Saint Scholastica, Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*). Nuremberg: Anton Koberger, 1493, p. 144r.

Cenobitic life began at Sacro Speco under Abbot Romanus (r. 1192-1216). The extant buildings date from the thirteenth and fourteenth centuries. Shortly before 1200 there existed a community of twelve, which Pope Innocent III (r. 1198-1216) made a priory dependent on Saint Scholastica, Innocent visited Saint Scholastica in 1202 and increased the revenues of the abbey with generous donations.

In the late Middle Ages, the monastery of Saint Scholastica fell prey to internal strife and dissension. In 1364, by command of Pope Urban V (r. 1362–1370), Abbot Bartholomew of Siena (1363-1369) dismissed some of the incorrigible religious and replaced them with religious from other monasteries, especially from Germany. Pope Urban VI (r. 1378-1389) abolished the custom of electing abbots for life, took away

from the monks the right of election, and gave the administration of the abbey and its revenues to members of the Roman curia.

Sylvester I, Pope

Pope Sylvester I (saint, d. 335, r. 314-335) succeeded Pope Miltiades. Sylvester seems to have become prominent during Emperor Diocletian's persecutions of the Christians. Sylvester did not attend either the Council of Aries (314) or the Council of Nicaea (325), but he was represented at least at Nicaea by two presbyters. A reverential letter (the extant text is partially corrupt) from the bishops assembled at Aries informed him of that synod's decision against the Donatists, a group of primarily African Christians with what later became heretical beliefs

who had appealed to the emperor. Probably in the eighth century, remains of Pope Sylvester I were translated to the church of San Silvestro in Capite near the Trevi Fountain in Rome.

Historically, Sylvester's contribution to the development of the papacy is negligible. However, owing to a fifth-century forgery known as the *Acts of Sylvester*, his legendary baptism of Constantine became part of an eighth-century forgery, the influential Donation of Constantine. According to Constantine's confession in the Donation, pagan priests had advised him to bathe in the blood of innocent children in order to be healed of his leprosy. However, the apostles Peter and Paul had appeared to him in a dream, instructing him to approach Pope Sylvester, who had fled to the Soracte mountain north of Rome. According to the legend, Sylvester's baptism healed Constantine. Saint Sylvester's feast day is 31 December.

Sylvester II, Pope

Pope Sylvester II (Gerbert of Aurillac; c. 940 or 945-1003, r. 2 April 999-12 May 1003) was born near Aurillac in southcentral France. He entered a monastery early in life. During a stay in Catalonia, he came into contact with Muslim science.

Gerbert met Pope John XIII while on a trip to Rome. John was impressed by the young monk and sent him on an embassy to Emperor Otto I, who, in turn, appointed him tutor to his son, Otto II. From 972 to 980, Gerbert was at Reims, a center of cultural activity.

In 980, on another trip to Italy, Gerbert met his former student Otto II. Otto appointed Gerbert abbot of the important monastery of Saint Columban at Bobbio in northern Italy. When Otto II died in December 983, Gerbert went to Pavia, where the empress Adelaide (Otto II's mother) resided, together with Theophano, Otto's widow. Gerbert was entrusted by the two women with a critical diplomatic mission to Germany. There, he helped put down a revolt of the nobility and also secured the release of the three-year-old Otto III, heir to the throne, who had been seized by the rebellious nobles.

Gerbert became archbishop of Reims in 991, ousting the previous archbishop, Arnulf. This gave rise to a long dispute, which Gerbert ultimately lost.

In 997, Gerbert left Reims for Germany to join Otto III, whom he had met in 996. Otto III, like his father, was attracted by Gerbert and in 998 appointed him archbishop of Ravenna. After the death of Pope Gregory V in February 999, Gerbert became Pope Sylvester II.

Sylvester had a policy of close cooperation between church and state, vigorous reform, and outreach to Scandinavia and eastern Europe. Hungary and Poland both entered the Roman church during his

pontificate. Sylvester was also important to mathematics, for he introduced Arabic numbers to Europe, replacing the more cumbersome Roman numerals.

Syracuse

Syracuse (Siracusa), one of the oldest Greek settlements in Sicily, was also an important Byzantine base before the Arab conquest of the ninth century. Its cathedral, incorporating an ancient Greek temple, is testimony to the many religious changes that have taken place in the history of Sicily. The city appears to have contracted in size after the Roman period, and the medieval city was concentrated on the former island of Ortygia, which was only part of the ancient site. Its early Christian catacombs date from the first century to the eighth and contain significant artistic decorations.

Syracuse long remained a preoccupation of the Byzantines in the face of their "barbarian" enemies. Belisarius occupied the city in 535. In 663-668, Emperor Constans II planned to make Syracuse his main base, in lieu of Constantinople, but he was murdered in his bath by opponents of his schemes. The Greeks briefly reoccupied Syracuse in 963. In the tenth century and the early eleventh, under Muslim rule (which began in 878), Syracuse was an important trading station, exporting silk and hides to Egypt, according to the Cairo Genizah letters. By the thirteenth century, it had become an important center of cheese production, including kosher cheeses for Jews in the Levant. Syracuse was closely linked to Malta, for which it provided access to Sicilian and wider markets. However, the fertile grain-producing

hinterland made Syracuse a target for conquest by outsiders.

Cathedral, Syracuse. Photograph courtesy of Christopher Kleinhenz.

In 1040, the Greek general George Maniakes attempted, unsuccessfully, to capture Syracuse from the Arabs. It later fell to the Normans, in 1085—thirteen years after Palermo and five years before the last Muslim stronghold in Sicily, Noto. The Normans installed a bishopric in the city. Syracuse became the object of Genoa's ambitions in 1162, when Frederick I Barba-rossa, the German emperor, promised the city and part of the countryside stretching toward Noto to Genoa in return for naval aid against the Norman king. In 1194, the Genoese helped Henry VI seize Syracuse, but (despite his confirmation of the treaty of 1162) he refused to hand over the city to them. Frustrated by Henry, the Genoese took advantage of the disorder that followed his death in 1197 to install themselves in the city in 1204. Alamanno da Costa became count of Syracuse, while his fellow Genoese Enrico Pescatore established himself in Malta. Alamanno described himself as "count of Syracuse by the grace of God, the king and the commune of Genoa," though it is unclear whether this title was a personal invention. These two pirates—Alamanno and Enrico—created a surprisingly powerful naval alliance, tacitly supported by Genoa itself; in 1205 they withstood a Pisan siege of Syracuse, which marked the end of a bitter competition between the two great naval powers for control of the

eastern Sicilian ports. The Provençal troubadour Peire Vidal spent time with Enrico and Alamanno, praising both sea captains for their successes, which extended as far east as the crusader county of Tripoli. From 1206 on, Alamanno aided Enrico of Malta in an attempted conquest of Crete, to which Venice had a prior claim; but Alamanno was captured. He was not released until 1218, when the count of Malta renounced his Cretan pretensions in favor of Venice. The count of Syracuse was therefore one of the key figures in the development of a lasting rivalry between Genoa and Venice. However, in 1220 Emperor Frederick II began his program of recovering royal rights in Sicily, and the Genoese were expelled from Syracuse. Indeed, Frederick granted the city the title *fidelissima*.

Castello Maniace, Syracuse. Photo graph courtesy of Christopher Kleinhenz.

Syracuse, like most Sicilian cities, was much more enthusiastic about the house of Barcelona than that of Anjou during the fight for Sicily that followed the revolt of the Vespers in March 1282. From the reign of Frederick III (d. 1337) until 1538, Syracuse formed part of the *camera reginale*, the lands of the queen of Sicily. The city benefited from tax exemptions after the Vespers. In 1318, Frederick III confirmed the city's statutes, or *consuetudines*. Further rewards followed in the same period after Syracuse put up a stalwart resistance to Robert of Anjou; these included, notably, a monopoly on the loading and unloading of goods

along the southeastern coast of Sicily. King Martin I (d. 1409) made the city a free port and elevated the city council to the title of senate. However, the existence of both a city administration and administrators of the queen's estate within the same town gave rise to occasional trouble, for example in 1448. In the fifteenth century, craft guilds emerged in Syracuse, as in other Sicilian towns. Syracuse was an important exit point for grain produced in southeastern Sicily. In the late Middle Ages, the Syracusans were much involved in trade with Malta, exchanging grain and other necessities for Maltese cotton, which was then passed into the Mediterranean trade routes.

T

Taddeo Alderotti

Taddeo Alderotti (c. 1206 or 1215-1295), a Florentine, was a physician, teacher, writer, and medical entrepreneur. He had one of the most spectacularly successful medical careers of the medieval period in Italy. His teaching—at Bologna during the height of its fame for its medical studies—was legendary, as were his learning and his great wealth. His medical writings are justly renowned, as are his opinions on philosophy and alchemy, on which he wrote a poem. He even merited mention by Dante, in the *Commedia* (*Paradiso*, 12.82-84).

Taddeo's life is known partly through municipal records of his property holdings, business transactions, loans, and investments; he also gave clues in his own works. However, the best source of his life is contained in the *Liber de civitatis Florentine famosis civibus* of Filippo Villani, written in the later fourteenth century, which, as Siraisi (1981) has shown, is substantiated by other sources.

Taddeo's is a classic rags-to-riches story. He appears to have been born into a Florentine family of modest means, about which little is known. He had two brothers, perhaps a sister, and, by his own testimony, an uncle who was a surgeon. In 1274, he married Adela de' Regaletti, who was from a prominent Florentine family. Taddeo and Adela had a daughter, Mina, but no son; and toward the end of his life, Taddeo petitioned the pope to legitimate his natural son, Taddeolo, so that there would be an heir for his substantial estate, worth 3,000 gold florins and 10,000 Bolognese lire.

Taddeo probably acquired his medical and philosophical education either at Florence or, more likely, at Bologna. About 1265, he began teaching medicine and logic at Bologna. This was the only place where Taddeo taught, but his students went on to teach at other Italian medical schools, and at Paris, Montpellier, and elsewhere. They include some of the most illustrious figures of the thirteenth and fourteenth

centuries: Bartolomeo da Varignana, Mondino de' Luizzi, Dino del Garbo, Turisanus, and many others. Taddeo's patrons included members of noble and royal households, a doge of Venice, King Enzo (the natural son of Frederick II), and perhaps Pope Honorius IV. Taddeo wrote a medical *consilium* for the famous surgeon and bishop Theodric of Lucca. Taddeo's writings also include commentaries on the works of Hippocrates, Galen, and Avicenna, and probably an Italian translation (from Latin) of Aristotle's *Nicomachean Ethics*.

Taddeo Di Bartolo

Taddeo di Bartolo (c. 1362 or 1363-after 28 August 1422) was the most important and innovative Siennese painter active between 1390 and 1420. He also served several times as a political official. His style, like that of other Siennese painters of the second half of the fourteenth century, was based on the tradition established by Duccio, Simone Martini, and the Lorenzetti brothers in the first half of the century. But Taddeo's particular synthesis of sumptuous Siennese decorative effects with bulky, well-modeled figures and effects of space and setting also suggests a move toward the illusionism characteristic of later developments.

Unlike most Siennese painters of the period, Taddeo had a reputation well beyond Siena; he worked for patrons from Genoa, Pisa, Montepulciano, San Gimignano, Perugia, and perhaps also Padua. At the height of his popularity he was the master of a large workshop.

However, as is typical of this period, many documented works do not survive, and how many undocumented works are lost is purely a matter of conjecture. Among Taddeo's most impressive surviving works is a large, well-preserved Gothic polyptych of the *Assumption and Coronation of the Virgin* in the cathedral of Montepulciano. It is signed and dated 1401; in addition, and unexpectedly, the artist has included Saint Thaddeus, his patron saint, who looks out at the observer in what must be one of the earliest self-portraits.

Taddeo's frescoes in the chapel in the Palazzo Pubblico in Siena were executed in stages between 1406 and 1414. In the *Last Days of the Virgin*, Taddeo adds a convincing—and, again, unexpected—effect to the scene in which the apostles are summoned back from their proselytizing to bid farewell to the Virgin before her dormition (i.e., her passing from earthly life). Here he shows foreshortened figures flying through the air, making the miraculous quality of the story more evident. The civic subjects include political virtues and Roman gods and heroes, themes planned by two Sienese intellectuals that provide yet another example of the interest in antique subjects during the Middle Ages.

Tagliacozzo, Battle of

In the battle of Taghacozzo (22 August 1268), between Conrad of Hohenstaufen (Conradin) and Charles of Anjou, Charles was the victor. This victory ensured that he would retain the kingdom of Naples and Sicily, which had been won two years previously at the battle of Benevento.

Conradin, the last male iiohenstaufen, had challenged the Angevin claim as the legitimate descendant in the direct line, through his grandfather, Frederick II, of the Norman kings. As Conradin was only sixteen years old, the effective command of his troops was undertaken by Prince Henry, who was the younger brother of the king of Castile and was senator of Rome. The battle took place at Scurcola on the Salto River, about 5 miles (8 kilometers) east of Tagliacozzo, where Henry had gone to avoid being trapped in the narrow defile of Tagliacozzo itself. Conradin probably had the numerical advantage—perhaps 6,000 soldiers to Charles's 5,000. The Angevin troops, however, were veterans and famously loyal to Charles, whereas the Hohenstaufen troops—who included German and Spanish mercenaries, Italian Ghibellines, and refugees from the Regno—were less disciplined and on the whole less interested in the outcome. After a bad start, Charles managed to divide the Hohenstaufen troops and drive them into flight. Henry was captured after the battle; he was to spend the next twenty-three years in prison. Shortly afterward, Conradin too was captured and executed.

Following the battle, Charles, abandoning a policy of clemency adopted after his previous victory at Benevento, viciously repressed many areas, particularly in Sicily, Apulia, and Basilicata, which had risen in sympathy with Conradin. Charles thereby incurred much hatred, which would lead to trouble later.

Talenti, Francesco

The Tuscan architect and sculptor Francesco Talenti (c. 1300-after 1369) is best remembered for his contribution to the building of the cathedral of Florence between 1351 and 1369. His son Simone Talenti (c. 1330-after 1383) followed in his footsteps and worked on the cathedral, as well as Or San Michele and the Loggia dei Priori. Francesco may have been the brother of Fra Jacopo Talenti (c. 1300-1362), who undertook building work at Santa Maria Novella.

In the 1350s, Francesco Talenti worked on the campanile begun by Giotto and taken over by Andrea Pisano, designing the two middle stories and the upper section of the tower shaft. During this decade he also worked on the two doorways—Porta dei Cornacchini and Porta del Campanile—in the north and south facades of the cathedral. Opinion differs as to the exact nature of Talenti's role in the final designs for the cathedral; not everyone would agree that he was responsible for the project to include a dome, first mentioned in 1357. As well as producing a model of the choir chapels (1355), Francesco Talenti made a model of the nave piers (1358); carved the capital for the first pier in the nave, assisted by his son (1358); and submitted a design of the choir in collaboration with Lapo Ghini (1366-1367).

Tancred of Hauteville, Sons of

Tancred of Hauteville (d. 1041) was a petty Norman noble who held a small fief about 8 miles (12 or 13 kilometers) northeast of Coutances. For Duke Robert of Normandy, he commanded ten men-at-arms from his castle at Hauteville-la-Guichard. Tancred and his first wife, Muriella, had five sons: William, Drogo, Humphrey, Geoffrey, and Serlo. When Muriella died, Tancred married Fressenda, with whom he fathered Robert Guiscard, Mauger, William, Aubrey, Tancred, Humbert, and Roger.

Clearly, Tancred's resources were far too meager to provide much of an inheritance for such numerous progeny. Hence, William (Iron Arm), Drogo, and Humphrey set off for southern Italy c. 1035 to seek their fortune with Rainulf, who had already begun his career from the county of Aversa as his territorial base. The three brothers along with Rainulf contributed to the Lombards' victories over the Byzantines at Montemaggiore on 4 May 1041 and at Montepeloso in September 1041. Thereafter, the Normans assumed more and more control of the Lombard insurrection. After William died in 1046, the leadership of the Normans in Apulia fell to his brother Drogo, who received in 1047 full imperial investiture as duke of Apulia from Henry III (r. 1039–1056). Drogo was killed along with sixty of his followers in 1051. Norman leadership now fell to Humphrey. Along with other bands of Normans, he defeated Pope Leo IX (r. 1049–1054) and Leo's Byzantine allies at Civitate in 1053.

In 1057, Humphrey died, and Norman leadership then fell to Robert Guiscard, the first son of Tancred and Fressenda. Robert continued the conquest of Calabria, which he had begun a few years earlier on his arrival in southern Italy. He moved as far south as Reggio, which he, along with his brother Roger, besieged in 1058. These two brothers quarreled, and Roger accepted the hospitality of his brother William of Hauteville, count of the Principate, who, in the four years since his arrival in southern Italy, had conquered all the land south of Salerno. Robert, who was left to face another revolt of the Calabrians, was quick to patch up his differences with his brother Roger, and eventually the two of them would complete the conquest of Sicily and southern Italy.

At the synod of Melfi in 1059, Robert Guiscard acquired the title of duke of Apulia and now had only to complete its conquest. In October 1060, Robert and his brother Mauger, count of the Capitanata, confronted the invading forces of the Byzantine emperor Constantine X Ducas (r. 1059-1067) and secured the conquest of Taranto, Brindisi, and Reggio. In 1060, Robert landed with his brother Roger in Sicily to initiate the conquest of that island. Called back to the mainland to suppress Apulian rebels, Robert completed his domination of southern Italy with the conquest of the last remaining Byzantine stronghold, the port city of Bari, in 1071. Returning to Sicily, he again assisted his brother in its conquest. In 1072, Palermo fell. Robert was then called back to southern Italy to suppress a rebellion of Norman nobles and to face the hostility of Richard of Capua and Pope Gregory VII, who excommunicated him. Robert triumphed on the battlefield, and Gregory's need for protection against Emperor Henry IV provoked Robert Guiscard to inflict his infamous devastation on the city of Rome in 1084, with the consequent flight of Gregory to Salerno. Robert died in July 1075 at age seventy.

In the meantime, Roger's campaigns in Sicily met such success that finally, by the year 1091, all the Saracens in Sicily as well as those in Malta were defeated. When Count Roger I of Sicily died in 1101, he left a well-organized and well-administered feudal state.

Tancred of Lecce and Roger III, Kings of

Sicily

Tancred of Lecce (c. 1137-20 February 1194) was an illegitimate son of Roger, duke of Apulia, the eldest son of Roger II. Tancred was twice involved in baronial rebellions against William I, was exiled in 1161, and spent at least the last part of his enforced absence in eastern Roman (Byzantine) territory. He was recalled in 1167 or 1168, during the regency of Margaret of Navarre, and in 1169 was made count of Lecce, a small fief on the Salentine peninsula, formerly the possession of what appears to have been his mother's family. He is sometimes thought to have led the Sicilian expeditionary force in Egypt in 1174. By 1176, he was grand constable and master justiciar for Apulia and Terra di Lavoro, a post he continued to hold at least until 1187- He commanded the fleet in William II's failed attempt to take Constantinople in 1185- In the succession crisis of late 1189, he was the candidate of a faction in the central government led by the vice-chancellor, Matthew of Salerno. In December 1189, Tancred was elected king by an assembly of curial magnates who were opposed to the prospect of rule by William's announced heir Constance, or by her German husband, the future western emperor Henry VI. After obtaining the support of the papacy, Tancred was crowned on 18 January 1190.

Tancred was an effective ruler in an insecure position. He put down an Arab-Islamic revolt at the outset of his reign; gained internal support by means of appointments and concessions; suppressed a rival candidate, Roger of Andria, for the throne; and through a combination of diplomacy, military success, and shows of force managed to fend off Henry's major invasion of 1191 and other attempts from 1190 onward to bring the kingdom within the empire. Prominent in this effort were Tancred's brother-in-law and military commander on the mainland, Richard of Acerra; and his admiral of the fleet, Margaritus of Brindisi, a holdover from the previous reign. Like Tancred, Richard had learned firsthand during William II's disastrous invasion of Greece that a new but energetic regime fighting on its own soil could defeat a large enemy army seeking to overthrow it. Margaritus was instrumental in carrying out their strategy, particularly in the defense of Naples in 1191. At Naples, by keeping open its maritime supply lines and winning a naval

victory over Henry's Pisan allies, Margaritus forced Henry to abandon his lengthy siege of this crucial strongpoint, and with it his very expensive campaign of that year.

Tancred was over fifty—and thus elderly by contemporary standards—when he came to power. He provided for the succession in 1192 by having his son Roger also crowned king, as Roger III. In the same year he negotiated an alliance with Isaac II Angelus, the Roman emperor of the east, an accord sealed by a marriage between Isaac's daughter Irene and the young Roger III. Tancred also allied himself with Richard I of England and with the papacy. But in 1193, once Richard had become the prisoner of Henry VI, this was a coalition of the weak and the disabled. Roger III's untimely death on 24 December left only his brother William, still a child, in line to succeed. When Tancred himself died less than two months later, the way was open for Henry's successful invasion of 1194 (funded from the proceeds of Richard's enormous ransom).

Roger and Tancred were both buried in Palermo's then new cathedral. There, on Henry's orders, their bodies were later stripped of crowns and other regalia (when the bodies were examined during a reconstruction in 1767, the remains, since lost, were said to have been headless). As Tancred's official acts were declared invalid by the new regime, the surviving documentation for his reign is scant. Peter of Eboli's illustrated *Liber ad honorem Augusti* lampoons Tancred memorably from a pro-Staufen perspective. Tancred's predecessors on the throne are known for their artistically important buildings in or near the capital; Tancred's own monument, more modest but still impressive, is the convent church of saints Nicholas and Cataldus at Lecce, completed in 1180. This edifice retains much of its original form, and it preserves, especially in its two ornamental portals with their dedicatory inscriptions in Leonine Latin verse, the memory of its donor when he was count and not yet king.

Tancredi Da Bologna

Tancredi (d. 1236) studied canon law in Bologna with Laurentius Hispanus and Johannes Galensis. He also studied civil law with Azo. He commented on the *Breviarium decretalium* of Bernardo da Pavia; on a collection of Innocent III's decretals by Pietro da Benevento (1210); and on a collection by Johannes Galensis filling the gap between those two (1210–1215). Tancredi wrote a widely known guide to legal procedure (c. 1218), basing his work on earlier texts. This text remained popular until the *Speculum judiciale* of Guillelmus Durantis the Elder appeared in 1271. Tancredi became a canon of Bologna and served as the city's archdeacon until his death.

Tavola Ritonda

The *Tavola ritonda* (*Round Table*), one of the earliest examples of vernacular prose narrative, composed c. 1320-1340, survives in eight manuscripts, indicating a healthy circulation for such a text. The anonymous author freely drew on several French sources—the prose *Tristan*, Thomas's *Tristan*, the *Roman de Lancelot*, *Meliadus* by Rusticiano da Pisa, and the *Tristano Riccardiano*. The originality in selection and the arrangement of material combined with several

invented episodes make the *Tavola ritonda* the most elaborate and innovative of the Italian Arthurian romances. Although criticism on this text is not extensive, the varied, even conflicting, interpretations of crucial themes, episodes, and characterizations testify to its complexity.

The Tuscan author reworked his source material—often filled with fabulous adventures—to appeal to the tastes of his pragmatic merchant-class readers. By rearranging and interspersing parallel scenes, he idealizes Tristan as both a better knight and a better lover than Lancelot. The adulterous aspects of Tristan and Isolde's passion are minimized to show their love as more pure and "loyal" than that of Lancelot and Guinivere, indeed as almost divine. This favorable portrayal of adulterous lovers may be a direct response to Dante's condemnation of carnal lust in *Inferno* 5.

Although Arthurian romances typically have love as "heir theme, in this redaction feats of arms are given equal importance. Yet this is a new brand of chivalry that domesticates the errant knight by channeling his energies into the defense of urban *securitas*, an ethos more in line with the civic ideals of communal Italy. There is less gratuitous jousting and more purposeful combat than in earlier versions. In addition, diplomacy can be as efficacious as physical prowess (a portrayal that echoes contemporary Florentine military history). Certain critics have pointed to a "social theme," also consonant with communal ethics: an individual's actions can have an impact, for good or ill, on his entire society.

Tedaldi, Pieraccio

The Florentine poet Pieraccio Tedaldi (first half of the fourteenth century) wrote in both the amorous-courtly and the comic styles. He wrote forty sonnets and one *tenzone*, all transmitted by a single manuscript, Vaticano Latino 3213.

Although Tedaldi wrote six sonnets following the aulic (courtly) tradition, he is best-known as a comic poet. The comic themes he used most often were condemnations of marriage, wry comments on the overinflated value of money in contemporary society, and lamentations against poverty. He also wrote a series of political sonnets as an impassioned Gueft, two of which are directed against Mastino II della Scala. Moral sonnets that he wrote in his old age include diatribes against gambling; warnings to lawyers, judges, and notaries against corruption; and accusations that society is pursuing sensual pleasures rather than serving God. In religious sonnets from the same period, Tedaldi confesses his own sins and prays for forgiveness. There are also sonnets concerning his blindness, which he considered a divine punishment for past sins. The *tenzone*, addressed to his son, Bindo, accuses Bindo of never taking the time to write his father a letter. Among Tedaldi's well-known poems, *Qualunque voi super far un sonetto* describes how to write a good sonnet, and *Sonetto pien di doglia, iscapigliato* is a *planctus* (lament) for the death of Dante, whom Tedaldi calls "our sweet master."

Teginae, Battle of

The battle of Teginae (Busta Gallorum, 552), the last battle of King Totila, doomed the Ostrogoths' resistance to the eastern Roman armies under Narses. Before the arrival of Narses in Italy (551), neither the Goths nor the eastern Romans had been able to field an army large enough to gain a decisive advantage. Totila knew that the longer he waited, the stronger Narses would become, and so he hastened to attack immediately. The battle pitted a Roman force drawn up in mixed array against Gothic cavalry backed by Gothic infantry. Totila, seeing that his force was greatly outnumbered, delayed, while an additional 2,000 men assembled from nearby camps. He guided his horse to the middle ground between the warring armies and wheeled his mount in a circle—first in one direction, then in the other, tossing his javelin high in the air and catching it. Surely this dance evoked something noble and warlike from Gothic tradition. The Gothic cavalry struck the first blow but was soon pushed back into the protection of the Gothic infantry. There, among the rank and file, without his golden armor, Totila died

along with some 6,000 others.

The survivors fled and rallied under their last king, Teias; but at Mons Lactarius near Naples later in 552, Teias fell. In August 554, Justinian issued his pragmatic sanction for the governing of reconquered Italy.

Tenzone

Like other early vernacular lyric forms brought to Sicily and to northern Italy by thirteenth-century troubadours, the *tenzone* probably developed from the Occitan *tenso*, or poetic debate. The related *contrasto* evolved from a medieval Latin analogue that contained a philosophical disputation within a single composition by one author, alternating voices stylistically or structurally between strophes; but the typical *tenzone* consists of at least two separate microtexts (normally sonnets; rarely *canzoni*) written by individual poets who are sometimes joined by additional voices. Topics include love, poetics, and politics.

Virtually every poet participated in the huge production of *tenzoni* in the second half of the thirteenth century: Monte Andrea da Firenze initiated a long political debate with various poets; Bonagiunta da Lucca and Guido Guinizzelli participated in a famous debate; Dante Alighieri exchanged poems with Dante da Maiano and with Cino da Pistoia. Several extant *tenzoni* included anonymous women "respondents." A particularly biting six-sonnet *tenzone* between the

young Dante and his future wife's relative Forese Donati (d. 1296) has been a source of unending controversy: despite codicological, lexical, and textual evidence, many scholars cannot accept the possibility that the great poet could have entered into a scurrilous debate.

Since the *tenzone* was a small but ordered grouping of textually related poetic compositions, it may be considered a forerunner of the poetry book. The *tenzone* was recognized as an independent genre by contemporary copyists, who often labeled it as such and even numbered the related texts in their manuscripts.

Terence

Little is known about the life of Terence (Publius Terentius Afer, c. 186 or 185-c. 159 B.C.). He was born in Carthage, and some scholars argue for an earlier birth date than 185 B.C. He came to Rome, perhaps as a slave; there, he received support from noble patrons.

Six of Terence's comedies have been transmitted to us: *Andria*, *Hecyra* (*The Mother-in-Law*), *Heautontimoroumenos* (*The Self-Punisher*), *Eunuchus* (Terence's greatest commercial success), *Phormio*, and *Adelphoe* (*The Brothers*). The plots of these plays are influenced by Attic "new comedy," but Terence's attention to character development represents an innovation in the comic genre. During antiquity, Terence's work was considered dull, lacking in verbal invention and comic ingeniousness, but Terence's focus on psychology provides a point of interest not found in the plays of his contemporaries.

In the fourth century the grammarian Donatus composed an extensive commentary on Terence's plays, and in the Middle Ages Terence was a hugely influential school author. His lucid Latin and didactic tendencies made him very appealing to a Christian readership; his plays were commended for their ethical messages. His central role in medieval school curricula allowed a wide dissemination of his work. In the tenth century Terence influenced the dramatic efforts of the German nun Hrosvitha (Hrotsvitha, Hroswita) of Gandersheim; and in the twelfth century a genre of pseudo-Terentian satirical dramas flourished.

While Dante alludes in a general way to Terence's comedies, there is no concrete evidence that he knew the plays in detail. An inaccurate reference in *Inferno* 18 to the courtesan Thai's, a character in *Eunuchus*, reveals that Dante's knowledge of the play was derived from Cicero's *De amicitia* rather than from *Eunuchus* itself. Beginning with Boccaccio and continuing with Petrarch, however, Terence's plays were copied, studied, and understood, as is evidenced by annotations on a Florentine manuscript of Terence's comedies in Boccaccio's hand.

Texts, Early Italian: Placiti Cassinesi

The *Placiti cassinesi*, also known as the *Placiti campani*, are a collection of tenth-century juridical documents preserved in the archives of the abbey of Monte Cassino and still in the possession of the abbey. They are generally said to contain the first extant manifestations of intentional writing in the *volgare* on the Italian peninsula. Each document consists of a body of text in Latin, with single sentences of a formulaic nature, in what appears to be a rather faithful rendering of the language of the time and place. The purpose of the documents is to establish disputed ownership of lands.

The earliest document was drawn up in Capua in March 960 and is thus widely known as the *placito capuano*, or alternatively as the *placito d'Arechisi*, after the judge in charge of the proceedings. The case pits the abbot of Monte Cassino against a private citizen named Rodelgrimo, who claims to have inherited lands that the abbot claims have been the property of Monte Cassino for thirty years. With neither side in possession of documentation of ownership, the judge orders the abbot to produce three witnesses, each of whom then repeats the words *Sao ko kelle terre per kelle fini que ki contene, trenta anni le possette parte S(an)c(t)i Benedicti* and swears that this is true.

I he *placito of Sessa*, from March 963, reports a similar case between the abbot of the monastery of San Salvatore and a citizen named Gualfrid. Here, however, the abbot is able to produce documentation showing that the land was in part purchased, in part received as a donation, from a certain Pergoaldo. Three witnesses are then called on to testify that this previous owner had been in legitimate possession, which they do by reciting *Sao cco kelle terre p(er) kelle fini que tebe monstrai P(er)goaldo foro que ki contene et trenta anni le possette*.

Two further documents deal with land disputes in the district of Teano. The earlier of these two, dated 26 July 963, is known as the *Memoratorium of Teano*-, it contains the oath *Kella terra p(er) kellefini q(ue) bobe mostrai S(an)c(t)e Marie è et trenta anni la posset parte S(an)c(t)e Marie*. The later of the two, the *Placito of Teano*, has four repetitions, one for each witness, of words nearly identical to those of the oath taken at Sessa: *Sao cco kelle terre p(er) kelle fini que tebe*

mostrai trenta anni le possette parte S(an)c(t)e Marie.

The prime interest of these documents is both historical and linguistic. Some scholars suspect that the disputes may have been preventive measures brought against straw men, for the purpose of establishing ownership of lands whose status could have been subject to genuine dispute in the absence of firm legal documentation. In this view, the use of popular language for the oaths would have served to make the essential information clear to any reader. Other scholars argue that certificates issued just a few years earlier by competent local authorities precluded any need for such legal reassurance, and the fact that only these documents contain testimony in the *volgare* may be due to their being originals. Others, which survive only in copies, have very similar oaths, invariably in Latin, arguably the result of emendation by copyists: e.g., *Scio quia ille terreper illos fines et mensuras quas Paidefrit comiti monstravimus per XXXa annos possedit pars Sancti Vincencii* (sworn in 954, also before Arechisi).

The Latin that frames and introduces the testimonies in *volgare* is unremarkably typical of practical papers of the time, lacking the accurate classicizing tone of highly trained authorship, and penetrated by localisms in Latinized form. It was once believed that the vernacular of the oaths was a conscious attempt at a refined version of the speech of the area, but various scholars have shown that they are almost certainly very accurate phonemic renderings of popular speech, with occasional phonetic detail, and few spurious Latinisms. Consider, for example, *Sao cco kelle terre* ("I know that those lands"). Although today dialects in Campania normally have a reflex of *sapio* ("I know") along the lines of *saccio*, the form *sao* ("I know," Italian *so*) is still common in southern Italy (along with, e.g., *fao*, "I make" or "I do"). *Co* (also spelled *ko*, and derived from *quod*) is still widespread in the south; and the simple [k], rather than [kw] (Italian *quella*) of *kelle* (derived from *eccu illae*, "those") parallels modern Neapolitan *kidde* (further evolved in the raising of [e] to [i] and the delateralization /ll/, from /dd/). These and other features appear to guarantee that the language of the *placiti* is genuine and thus is a valuable early documentation of evolved Romance speech.

Texts, Early Italian: Ritmo Laurenziano

The *Ritmo laurenziano* is so called because it is contained in the last folio of a codex in the Laurentian Library in Florence; it is also known variously as the *Ritmo giullaresco toscano*, the *Cantilena monorima*, or the *Cantilena di ungiullare toscano*. It is generally considered the oldest surviving Italian poetic composition with literary pretensions. The text is of uncertain date but is in a hand that suggests the late twelfth century or the early thirteenth century; the identity of the author is unknown.

The *Ritmo laurenziano* consists of twenty double octosyll-lables. The allusions made (apparently to the *Physiologus* and to the *Disricba Catonis*) and the poetic structure (recalling the Provençal *Sancta Fides*) reveal some learning on the part of the author. The ends, however, are practical: a *giullare* spares no hyperbole to sing the praises of a bishop (Villano, of Pisa, according to some scholars, but the bishop of Iesi now appears more likely), in hopes that the bishop will see fit to present him with the gift of a fine white-footed horse, which he will then display to the bishop of Volterra, Galgano. Though it was once thought that the language reflected an eastern Tuscan origin, this opinion has been shown to have little foundation. Until recently, parts of the text remained obscure. Lacunae and illegible script in the manuscript itself, along with puzzling lexical items, left the way open for numerous suggested readings of crucial passages. Castellan! (1986) made definitive corrections of earlier scholars' hypotheses, including the probable identification of the bishop to whom the work is addressed: *lo vescovo senato*, in which *senato* was once thought to have been a Tuscanized borrowing of a precursor of French *sent* ("wise"), is much more plausibly local usage deriving directly from Latin *aesinas*, producing "of Iesi." Castellani's informed philological analysis suggests that regarding origins all we can say with certainty is that the linguistic character of the text is genuinely Tuscan; also, both linguistic and nonlinguistic evidence hints that the author may have come from the diocese of

Volterra.

Theater

Theater was an essential part of medieval life and consequently encompassed more than today's restricted notion. However, the practice of going to the theater as a paid public event, purely for the purpose of entertainment, lapsed during the Middle Ages, even though formally structured plays with costumed actors, prepared speeches, scene changes, and music had been performed in ancient Roman theaters, and the ruins of these Roman edifices survived in medieval Italy.

Forerunners of popular theater in Italy were the numerous public spectacles, ceremonies, propitiatory processions of spiritual groups such as the flagellants, and even races, games, and athletic contests which developed distinct regional variations. To celebrate the rites of spring, rural Tuscan towns held popular dramas known by different names (*giostre* near Pistoia, *bruscelli* near Siena, *maggi* in Pisa and Lucca). Self-conscious displays of power and prestige by individual families or

political groups were prevalent in the late fourteenth century and the fifteenth century and constituted a kind of unofficial theater. Mummers and maskers in France and England had their parallel in the elaborate carnival parades and costumes of late medieval Florence and Venice. In Medici Florence, wagons (*carri*) bearing tableaux of costumed figures accompanied by music and singing often used mythological themes. Lorenzo de' Medici (il Magnifico) himself contributed texts for several carnival songs and is even credited with developing this genre.

Orally performed epics and *cantari* are a secular strain that fed into the development of theater in Italy. The *giullari*, later called *cantastorie* or *canterini*, would have used gestures, movements, simple sound effects, and a range of vocal inflections to enhance their texts, performed with the accompaniment of stringed instruments. Performers availed themselves of a raised platform such as a stone bench or staircase to make themselves more visible and to project their voices better. We can surmise this from one Italian noun for singers of tales: *cantimbanchi*, literally, "songs on the benches." These were extremely popular in Bologna, Florence, and Perugia, as documents indicate. Elements of this epic performance style survived in nineteenth century and early twentieth-century street theaters of Sicily and Naples.

The religious strain of early theater has left more written traces. Mystery plays were performed throughout Europe to illustrate Christian stories and principles, and Italy was no exception. The combination of text, music, costumes, sounds, and simple props or backdrops had the powerful effect of heightening spirituality. Subjects included Old and New Testament stories, especially the more dramatic episodes; saints' lives; and other sacred legends. These could have been simple (though costumed) tableaux "acted" by priests during a mass, or longer stories that were actually performed. *Luoghi deputati*—multiple sets used in succession—were used for religious dramas and were paralleled in the visual arts: frescoes and altarpieces often depicted a series of events in the life of Christ or a saint, each action in its own separate section or panel. In fact, a modern word for the formal stage preserves this early sense: *palcoscenico*, "scenic box."

Extant documentation indicates that religious plays were widespread throughout the peninsula and in Sicily. Since there were no established

commercial theater buildings, plays were performed within monasteries or convents, inside churches for special festivals, or in public squares. Without a clear stage separation from the audience seating area, such "interactive" dramas resembled modern experimental theater: actors could enter through the crowd, and audience members would have been physically much closer to the drama. The grotesque devils in Dante's *Commedia* (*Inferno*, 21-22) preserve a glimpse of the frantic tragicomic activities of demons issuing from "hell's mouth," a frequent element in the intermezzi of mystery plays.

The concept of plays for didactic purposes developed from *laude*, vernacular hymns of praise. These *laude* were of Umbrian origin and were used by Saint Francis and his followers in the early thirteenth century; they were sung or chanted and could also be accompanied by dancing as a popular expression of religious zeal. The *lauda* "Lament of the Virgin Mary" by Jacopone da Todi—which is in effect a mini-drama—is a moving dialogue between the Virgin and her son, who is dying on the cross. Each of the alternating stanzas represents the "speech" of a "character." Early *laude* survive from Perugia, Assisi, Gubbio, Orvieto, and Aquila.

Written scripts for many religious spectacles have survived, and archival documents and records of payments further indicate what kinds of theatrical activities took place. In the urban centers of late medieval Italy, civic and religious institutions inevitably came into contact. Their functions intermingled in a complex symbiosis, with public spaces being used for sacred displays, sacred spaces being invaded by individual propaganda, and financial support often deriving more from political opportunism than from charitable motivations. Churches and lay confraternities organized special dramatic spectacles for important feast days such as the Annunciation, Epiphany, and Ascension day. Companies of artisans and laymen dedicated themselves to these annual representations, just as today certain charitable or civic groups sponsor parades or local festivals in their communities. Scenery, lighting effects, and stage machinery became quite elaborate.

The *sacra rappresentazione*, a Tuscan phenomenon that flourished in the fifteenth century, was essentially popular in nature. Feo Beicari (1410-1484, Florence) is the best-known author in this genre. His surviving sacred plays, written in octaves, had as their themes

Abraham and Isaac, the Annunciation, the life of the blessed Giovanni Colombini, and Saint John the Baptist in the desert. A short *San Panuzio* is also attributed to him. Lorenzo de' Medici produced a single dramatic work, the *Sacra rappresentazione di Santi Giovanni e Paolo*. Such plays demonstrate a certain relationship to the epic in their meter, tone, and style. Their form was free, with no unity of time, place, or action. A closing epilogue provided the moral.

By the late fifteenth century, with the influence of humanism, *sacre rappresentazioni* were including more and more secular elements. An important contribution of humanism with respect to the history of theater in Italy was the rediscovery and actual performance of old Roman plays by Terence and Plautus, especially in the north, at Ferrara and Florence. Authors of the time imitated these ancient plays; for example, Machiavelli's *La Clizia*, performed in 1525, was based on Plautus's *Casina*.

Theodahad

Theodahad (d. 536, r. 534-536) was a king of the Ostrogoths. He was the son of Amalafrida, nephew of Theodoric, brother of Amalaberga, and father of Theudegisclus and Theodenantha. He led the life of a rich Roman recluse, *vir spectabilis* and later *vir inlustris*, devoting his leisure to literature, especially Plato. His wealth included lands belonging to the royal *patrimonium* and estates inherited from his mother (d. 527) but did not satisfy his avarice: before becoming king, he illegally evicted poor Gothic landowners and sometimes enslaved them, thwarted only by their appeals to his predecessor, King Athalaric.

The death of Athalaric (534) left Theodahad, the senior male member of the Amali family, in a peculiar and uncomfortable position. His cousin Amalasuntha, as a part of her program to frustrate the nobles who were opposed to her, asked him to succeed her son Athalaric in name only and actually to be a co-ruler with her. This proved unacceptable to Theodahad and the Gothic nobility. Amalasuntha was exiled and killed (535). She had, however, opened negotiations with Emperor Justinian I, and her death provided a pretext for him to commit his troops. Theodahad tried to explain himself to the emperor and gain Justinian's support, apparently even offering to trade his

personal estates for a comfortable life in Constantinople. However, his offer was rejected and his explanations were dismissed. War came swiftly, and no organized opposition to Justinian's forces emerged. The nobility rose and raised one of their own, Witigis, as king (536).

Theodahad was executed while in flight to Ravenna. He was the last Amalian king and the first barbarian ever to put his own portrait on a Roman coin.

THOMAS S. BURNS

Theodora

Theodora (c. 500-548) became empress of Byzantium in 527. She had been born in poverty and had spent her youth as a notoriously virtuosic courtesan in Constantinople. But she reformed, and her cleverness and strong personality attracted the young Justinian, who made her his wife and, on his ascent to the throne as Justinian I, his consort.

Although Theodora differed with Justinian on theology and, as a strong adherent of Monophysitism, sometimes worked against his policies, she was his invaluable ally and counselor. Her advice helped him rescue his throne during the Nika riots (532), and her death from cancer in 548 was a grievous blow to him personally and politically.

Theodora had risen from the dregs of society and never felt totally secure on her throne; she intrigued constantly to ward off any challenge she saw to her husband or to her own standing with him. Thus, it is said, Theodora became jealous of the Ostrogothic queen of Italy, Amalasuntha, who was famous for cleverness and beauty, and—anxious lest this woman come to the capital and attract Justinian—conspired to have her murdered as a part of the dynastic tangles of the Ostrogothic court. Theodora's support of the Monophysites was played on by the Roman legate Vigilius, who promised her his aid in return for her influence in having him made pope (537). However, Vigilius found it impossible to keep his promise, and Theodora became his implacable

foe. At her urging, Justinian had Vigilius abducted and brought to Constantinople to be coerced into supporting religious policies that Theodora had helped frame. Vigilius's degradation was Theodora's last triumph before her death.

Several portrait busts surviving from this period have been identified as Theodora, notably one that is now in the Castello Sforzesco in Milan. Even more striking is her austere portrayal, together with her retinue, in a famous mosaic panel in the church of San Vitale in Ravenna. Fired by the sensational account given of her by the historian Procopius, artists and writers of modern times have continued to be fascinated by her image: she has been the fanciful subject of an opera by Donizetti, a play by Sardou, numerous novels, and at least one (Italian) movie.

Theodoric

The Ostrogoth king Theodoric (Theodoric the Great; Thiudareiks,

"leader of the people"; c. 454—526) was the son of Thiudmir. As a boy of seven or eight, he was sent as a royal hostage to Constantinople to be reared along with other aristocratic children. That Theodoric remained unable to write never constrained his love of literature and theological discussion. He returned to his people as a man in 471 and with the aid of his father immediately began to assemble a following and lead them in battle. Thereby designated to succeed his father as king of the Ostrogoths, he did so in 474; but he then had to contend with Theodoric Strabo, leader of a rival line and *magister militum praesentalis*, for the rest of the decade. Their struggle was a competition for imperial support, political and economic, which was pivotal in securing the loyalty of the Ostrogoths then resident in the Balkans. Despite his eventual triumph and his own rise to the magistrship (483-487) and the consulship in 484, Theodoric the Great's relationship with the government in Constantinople remained strained. In 489, he was invited to lead his people into Italy as allies of the Romans and depose Odovacar, who was *patricius* and "king." After four years of war and attempted compromise, Theodoric hewed his adversary in two with his own hand. Theodoric then ruled from Ravenna until his own death.

Theodoric the man was complex, sometimes extremely volatile, but usually careful and calculating in the pursuit of his personal vision of the new realities within the Roman empire. His exact position remained ambiguous: *rex*, *Flavius*, *patricius*, *pius princeps invictus semper*, but never *Augustus*. He expanded the Amalian network of family alliances to include most of the ruling families of contemporary Germanic kingdoms, suggesting—as his correspondence also suggests—that he saw himself, his family, and the Ostrogothic kingdom as leading the western empire. He was also regent for the child king of the Visigoths, Alaric II. The Visigoths soon regarded the Ostrogothic forces dispatched by Theodoric as foreign and obtrusive. Theodoric's careful use of titles and attempts to have these confirmed or clarified by the emperor in Constantinople reveal that he thought of his and the other Germanic kingdoms as peculiar regional variations under Germanic kings serving simultaneously as imperial officials within the *imperium Romanum*, not as replacements for it.

Within the Ostrogothic domain, Theodoric envisioned that the Gothic and Roman populations should complement one another with

clearly recognized spheres of expertise allocated to their ruling elites—specifically, leadership in the military for the Goths while the administration of the civil bureaucracy remained in Roman hands. The two branches of one society would come together only in his hands or those of his family. In other words, Theodoric tried to stand at the apex of the countervailing currents of an age that saw itself as very much a part of the universal Roman empire. Beneath the royal family, he tried to control the peaceful fusion of peoples and cultures. In fact, however, his reign provided many unregulated opportunities for Ostrogoths and Romans to share ideas and blood without regard to royal wishes. Theodoric's vision was not lost on his successors, who continued to reach back to him for guidance and legitimacy. The *Nibelungenlied* enshrined Theodoric as Dietrich von Bern, and the writings of Cassiodorus and Jordanes left the Latin world ample testaments of Theodoric's subtle governmental policies.

Tomb of Theodoric, Ravenna. Photograph courtesy of John W. Barker.

Although Theodoric was an Arian Christian, he tolerated Orthodoxy and Judaism, saying that no king could tell his people what to believe. Such an enlightened attitude, combined with the peculiar relationship he maintained with Roman institutions, at once inside but independent, supported a religious and cultural flowering during his rule among the Roman populations. Pope Gelasius I and others took advantage of the independence of Italy within the imperial system to fashion a similar theoretical autonomy for the papacy and the Christian church in the west. Boethius and a circle of aristocratic scholars in support of

Theodoric saved much of ancient Greek philosophy from extinction by their devotion and their Latin translations. Cassiodorus (fl. c. 507-580) wrote extensively, thereby serving history and Christianity as loyally as he served Theodoric and Theodoric's successors. It is difficult to separate the vision of Cassiodorus and his student Jordanes from that of Theodoric. However, in areas where Theodoric's independence of thought cannot be doubted—such as in coinage, architecture, foreign policy, and titles—Theodoric himself clearly stands out as the seminal craftsman of his age. Cassiodorus was in sympathy with him and, in a sense, became his mouthpiece. In his own statements and actions, Theodoric was acutely conscious of displaying the imperial virtues of leadership—justice, clemency, piety, and manliness. He was also a proven warrior and general. His support of a gifted intellectual circle and numerous building programs in Ravenna, Verona, Rome, and elsewhere ensured that his virtues would receive lasting recognition. For him and a few other Germanic contemporaries, these attributes denoted their own successful leadership of Roman-Germanic society, naturally in the line of Augustus, but divorced from the office of emperor and therefore accepted within the emerging pattern of western rule. Ornaments for personal dress inspired by Ostrogothic tastes and manufactured in Ravenna flowed northward far beyond the Alps.

Theodoric's jurisdiction included all of Italy, Sicily, Provence in France, Bavaria, southern Austria, and northern Yugoslavia, with a regency over Visigothic lands in southwestern France and Spain. In most of the outlying areas Theodoric ruled through a few agents or garrisons. Yet in many areas Theodoric was the last effective representative of Rome. His final years were filled with disappointment. He suspected many members of his Roman-Orthodox aristocratic circle of treason against him and ordered Boethius executed; most of his marriage alliances with fellow Germanic kings ended in failure; his grandson and successor Athalaric was a minor.

Theodoric died of dysentery in 526 and was buried in Ravenna. His mausoleum is much like the man—a strange and complex mingling of Germanic traditions within Roman forms.

Theophano

Theophano (Theophanu, c. 955-c. 991) was a Byzantine (eastern Roman) princess who married Otto II of the Saxon dynasty. The father of Otto II—Otto I—had been rebuffed at least once in an attempt to arrange a marriage between his son and a Byzantine princess. But when the Byzantine emperor Nicephorus II Phocas was overthrown by the more pro-western John I Tzimisces (Zimisces) in December 969, a union was successfully arranged. Theophano arrived in Italy in 972 and married Otto II in April. They had three daughters—Adelaide (b. 977), Sophia (b. 978), and Matilda (b. 979)—and a son, Otto III (b. 980). When her husband died while her son was an infant, Theophano assumed the regency. On Theophano's death, Adelaide, who was Otto II's mother and Otto III's grandmother, came out of retirement and took over the regency.

The question of Theophano's influence on Otto III's attitudes and policies has been overshadowed by a controversy about precisely who she was. There can be no doubt that she was a Byzantine aristocrat, though she is mentioned in no extant Greek sources. Two theories have been offered about her exact identity: first, that she was a sister of the future emperor Basil II; and second, that she was a kinswoman of John I Tzimisces. Recent scholarship indicates that Theophano was most likely John's niece by marriage, the daughter of his brother-in-law, the patrician Constantine Sclerus, and Constantine's wife, Sophia.

Thomas Aquinas, Saint

Saint Thomas Aquinas (Tommaso d'Aquino, c. 1225–1274) is perhaps the most broadly influential philosopher and theologian in the entire Catholic tradition—his only serious rival for the title would be Augustine. Thomas was born at Roccasecca, near Aquino (whence his customary toponymic), to an aristocratic family. He was presented at an early age as an oblate to the Benedictine monastery at Monte Cassino. He studied there and in Naples (after 1239) before disappointing his family's hopes for his ecclesiastical preferment by developing an interest in the then recently founded Order of Preachers (Dominicans), which he entered in 1244. Despite initially intense opposition from his family (who went as far as imprisoning him for nearly two years in an attempt to break his resolve), he spent the rest of his life serving the Dominicans as a teacher, scholar, preacher, and writer. His studies took him far afield: first to Paris, where he had a decisive intellectual encounter with the theologian Albert the Great; then, following Albert, to Cologne in 1248-1252; then again to Paris, where he remained until 1259, pursuing the normal career path of an academic theologian by giving courses of lectures on the Bible and the *Sentences* of Peter Lombard, and taking his master's degree in theology in 1256. Returning to Italy in 1259, he taught in various places (Anagni, Orvieto, Rome, Viterbo) until being appointed to a chair of theology at Paris in 1268. His brief tenure there was marked by fierce controversy with other Parisian masters, including Siger of Brabant, whose well-known rivalry with Thomas is reflected in their presence—suitably reconciled—in the same sphere of Dante's *Paradiso*.

In 1272, perhaps (and, if so, understandably) weary of academic infighting, Aquinas returned to Italy and settled down to a life of study at a Dominican priory in Naples. This life was interrupted by a summons to attend the Council of Lyon in early 1274. While staying en route at the Cistercian abbey of Fossanuova, he died suddenly—poisoned, according to an unconfirmed but persistent contemporary legend, on the instructions of Charles of Anjou. Whatever its cause, his death did not appease his Parisian rivals, who worked energetically (and with some success) for the condemnation of his teachings in the

1270s; but in 1278 the Dominican order granted his writings official protection (at least within the order itself), and thereafter his reputation grew steadily. He was canonized by Pope John XXII in 1323. By the mid-sixteenth century, his importance to Catholic thinkers had reached a point where he could be seen by many as the presiding genius of the Council of Trent and, indeed, of the whole phenomenon of the Counter-Reformation: Pope Pius V proclaimed him a doctor of the church (*doctor angelicus*) in 1567. A modern rediscovery of Thomas's thoughts and writings among both lay and clerical thinkers, beginning in the 1870s with Leo XIII's laudatory bull *Aeterni patris* (1879), inspired the major current in twentieth-century Catholic thought known as neo-Thomism; and non-Catholic philosophers have shown increasing interest in him since the Second Vatican Council (1262-1265) inaugurated an era in which it became easier to consider the intellectual substance of his work independent of its confessional affiliation.

That substance is not easy to sum up in a few words, especially given Thomas's dauntingly vast output of writings. Speaking generally, however, it may be said first of all that Thomas, as both philosopher and theologian, sets a high value on the existence and workings of human reason (rather than disparaging it, as a mystic might). Therefore, he grants philosophy a specific and indeed crucial role in his overall scheme, as an intellectual activity which is both distinct from and inferior to theology but which is also an indispensable prolegomenon to theological study and is itself capable of exploring and expounding truths about the world and humanity's place in it. The relationship between reason and faith; the attempt to define their respective spheres of operation; and the consequences of such a definition for the individual human being's understanding of self, the world, and God thus stand at the very center of Thomas's preoccupations throughout his works. These works proceed from his early commentaries and manuals of *quaestiones disputatae* (derived from his teaching); through the *Summa contra gentiles*, begun c. 1258 as a handbook of natural theology for use by missionaries against the nonbelievers"; and many more treatises, commentaries, and expositions of biblical and Aristotelian texts; to his masterpiece, the *Summa theologiae*, begun in the mid-1260s and left unfinished at his death. The *Summa theologiae* has been recognized down to the present day as a uniquely

authoritative achievement in the systematic exposition and analysis of Christian doctrine.

All these writings are based on Aquinas's absolute faith in revelation, but with the conviction that revelation is susceptible, up to a point determined only by the limitations imposed by our essential humanness, of being *understood*. He therefore stands in the Anselmian tradition of *fides quaerens intellectum*, but, far more than his eleventh-century predecessor Anselm, he sets out to deepen *his fellow* Christians' understanding of their own faith by using intellectual and analytical tools bequeathed to him by pagan traditions of thought: Neoplatonism and, above all, Aristotelianism. His many commentaries on Aristotelian texts thus stand beside his biblical commentaries not in opposition (as a strong current of antipaganism in Christian thinking, harking back at least to Jerome, would have wanted), and not as hostile demolitions of intellectual straw figures, but as respectful recognitions of incomplete gestures in the direction of truth that he is seeking to integrate into his own attempt at intellectual synthesis. The rediscovery (and translation into Latin) of Aristotle's works, which had been ongoing in the west since the twelfth century, enabled Aquinas to revivify both philosophy and theology. The greater subtlety and precision of argument made possible by the adoption of concepts and terminology from the Aristotelian corpus were as useful in debates about the workings of human reason as they were in debates about the proper understanding of divine revelation—debates which, for Thomas himself, were in the last analysis no more than mutually interdependent efforts to advance from different starting points toward the same resplendent truth.

Thomas of Celano

Thomas of Celano (c. 1190-1260) was a Franciscan hagiographer, the author of the first two lives of Francis of Assisi. Little is known about Thomas's early life, except that he was apparently from a noble family and received a good education. He joined the Franciscan order in the first years of its existence, probably in 1215, and volunteered for the first Franciscan mission to Germany in 1221. He seems to have shown administrative talent, for the next year he was made *custos* of a substantial part of the central European province, and in 1223 he was appointed vicar for the entire province while its minister was in Italy. In 1224, Thomas returned to Italy. He may have been present when Francis died in 1226.

Thomas's reputation as a preacher and stylist and his status as a relatively early follower of Francis seem to be the reasons Pope Gregory IX commissioned him in July 1228 to write an official life of the saint. While preparing the work, Thomas amassed a huge collection of anecdotes from friars and laymen that became a source for several later lives of Francis. By February 1229, he had finished what would come to be called *Vita prima*. Written in *cursus*, or rhythmical prose, the *Vita prima* is a skillful attempt to convey the interior life of Francis as early Franciscans knew it. But in many ways it is also a conventional stereotyped hagiography. It emphasizes Francis's spiritual journey and ideals but omits some of the quirkiest and most compelling episodes of the saint's life. In 1230, Thomas edited the *Vita prima* into a liturgical epitome, the *Legenda ad usum chori*.

Although the *Vita prima* was greeted with enormous enthusiasm when it first appeared, by the early 1240s many friars were voicing dissatisfaction with it, apparently because so many favorite stories about Francis had been left out. In 1244, the Franciscan general chapter invited all friars who had known Francis to submit their reminiscences so that a new, more complete *vita* could be composed. Thomas was once again called on to be the author. From materials he had not used in his first life and from recently submitted anecdotes, Thomas crafted the *Memoriale in desiderio animae de gestis et verbis sanctissimipatris nostri Francisci*, usually called the *Vita secunda*. Like the first life, it tells the story of Francis's conversion; but in its second part the anecdotes are arranged as a kind of prolonged character study of the subject. The *Vita secunda*—unlike the *Vita prima*—confronts matters of controversy within the order, especially a growing dispute over the relaxation of the rule. Thomas clearly depicts Francis as favoring a strict adherence to the rule and lamenting the corruption of his order by those who sought to relax it.

If "laxists" found the general message of the *Vita secunda* distasteful, many throughout the order complained that it gave insufficient attention to Francis's miracles, a subject that had been carefully elaborated in the *Vita prima*. To remedy this, Thomas composed a *Tractatus de miraculis* in 1255-1256 that detailed almost 200 of Francis's miracles. Thomas may also be the author of the *Legenda sanctae Clarae*, a life of Francis's friend Saint Clare written in the mid-1250s.

Thomas died in 1260 at Tagliacozzo. His works survived, despite a directive of the Franciscan chapter general of 1266 ordering that they and all other lives of Francis be destroyed to facilitate acceptance of Bonaventure's *Legenda maior* as the only official version of Francis's life.

Tiepolo Family

The Tiepolo family, a merchant house, is first recorded at Malamocco in the Venetian lagoon but evidently immigrated to Venice in the later eleventh century. Members of the family were trading in Constantinople in the 1080s and thereafter maintained strong interests in the Orient. They entered public life in the twelfth century and reached their greatest prominence—twice occupying the office of doge—in four consecutive generations between the early thirteenth century and the early fourteenth.

Of the two Tiepolo doges, the first (Venice's forty-third) was Giacomo (Iacopo, Jacopo), who had achieved distinction in the east. His election in 1229 broke the hold on the chief magistracy of the ancient patrician houses, particularly those of Ziani and Dandolo, who resented the upstart's rise, while a lasting rivalry between *nobiles* and *populares* was emerging. Giacomo showed extraordinary skill in his dealings with the hostile emperor Frederick II, Ezzelino III da Romano, and other powers, though he was to be chiefly remembered for commissioning a new legal code (1242). Under him, the *comune* approached the ideal of maximum authority with maximum consensus, and his firm rule was credited with the peace and prosperity of the years immediately following his death (1249).

Giacomo's son Lorenzo became the forty-sixth doge (1268-1275), having married a niece of John of Brienne, Latin emperor of Constantinople, and having made his name by leading the reconquest of Acre (1258) with a crushing naval victory over the Genoese. Lorenzo was a very popular choice, and on his election he formally reconciled his house with that of Dandolo. He subsequently placated the guilds by allowing them limited self-government.

On the death of Doge Giovanni Dandolo (1289), a favored possible successor was a second Giacomo Tiepolo, who was the son of Lorenzo and was another victorious admiral. However, in electoral circles this Giacomo was seen as representing a threat of a hereditary *signoria* such as was taking shape elsewhere—something the evolving Venetian constitution resolutely opposed. In the event, Giacomo served Venice by avoiding election and the social strife that would have ensued.

Baiamonte, son of the younger Giacomo, did not share his father's deference to public interests. In 1310, he led an armed rising against the regime headed by Doge Pietro Gradenigo, whom he sought to replace. The insurrection failed, however, and Baiamonte was exiled by a ten-man commission established to deal with the emergency, a body that subsequently became known as the *consiglio dei died* and developed into a permanent and prominent institution of the Venetian state. The Baiamonte episode prompted the oligarchy to take still stricter measures to stifle any personality cult.

Partly, it may be inferred, as a result of Baiamonte's failure, the family was never so conspicuous again. It is reckoned to have been in Venice's top ten families in the 1260s, but a social chronicle of the 1350s places it in the second twelve, and a modern assessment has it just outside the top forty around that time. Later, the house produced its most illustrious scion of all, the Rococo painter Giovanni Battista (1696-1770). It is still today a respected component of Venetian society.

Tino Di Camaino

Tino di Camaino (c. 1280 or 1285-1337) was a Siennese sculptor. Although his works are numerous and varied, representing the range of

activities of a late medieval workshop, Tino is best-known for a series of important sepulchral monuments carved and erected in Siena, Pisa, Florence, and Naples.

Tino was born in Siena, the son of the sculptor Camaino di Crescentino. Camaino was for many years associated with the *opera del duomo* in Siena, for which he served as *capomaestro* between 1317 and 1320. As a young sculptor, Tino surely worked with his father at the cathedral, and there both father and son may also have been associated with the workshop of Giovanni Pisano. In certain passages of linear grace and fluidity, Tino's works show the influence of Giovanni Pisano; however, Tino, his own workshop, and his clients seem to have shied away from Giovanni Pisano's dramatic "expressionism" in favor of a more "classical" manner that resembles the art of Giotto and the Lorenzetti brothers. Tino's first documented work, a baptismal font for the cathedral at Pisa, dates to 1311. His first sepulchral monument, the tomb of the emperor Henry VII, was installed in the cathedral of Pisa in 1315. This wall tomb, with carved sarcophagus, recumbent effigy, and accompanying figures, was of a type that Tino would repeat and vary throughout his career.

Although Tino served as *capomaestro* of the cathedral of Pisa while carving the emperor's tomb, he temporarily left his position in 1315 to take part in an unsuccessful defense of Pisa against the *condottiere* Uguccone della Faggiuola. Tino escaped capture in the battle of Montecatini (1315), only to be deposed from his job as *capomaestro*. He then returned to Siena, where he executed the tomb of Cardinal Riccardo Petroni (c. 1318). The Petroni tomb, in the cathedral of Siena, is the best-preserved of Tino's sepulchral monuments in Tuscany. Tino was appointed *capomaestro* of this cathedral in 1320, but in 1321 he left to work in Florence. From 1321 to 1323, he is documented in Florence, where he executed the tomb of Gastone della Torre, the patriarch of Aquileia, in Santa Croce; the tomb of Antonio degli Orsi, the bishop of Florence, in the cathedral; and statues for the exterior of the Baptistry,

In 1323 or 1324, Tino was called to Naples, probably by King Robert of Anjou. He worked there, in the service of the Angevin court, for the remainder of his career. In Naples, he carved the sepulchral monuments for Robert's mother, Mary of Hungary, in Santa Maria Donna Regina; and for Robert's daughter-in-law, Catherine of Austria, in San Lorenzo.

In the church of Santa Chiara, he carved the tombs of Charles of Calabria and Mary of Valois. Tino also produced tombs for Philip of Taranto and Giovanni of Durazzo in San Domenico Maggiore.

In Naples, Tino was also active as an architect. After 1329, he was involved in the construction of the monastery of San Martino and Castel Belforte; he also directed work on the Angevin arsenal and was put in charge of the enlargement of the harbor of Naples. From 1334 to 1336, he assumed temporary control of Giotto's workshop in Naples. Pietro Lorenzetti became the guardian of Tino's children after Tino died in 1337.

Tithes and Tithing

See **Church Organization and Functions**

Titles, Official

A title is a label bestowed on a specific individual by a higher authority in recognition of the person's office, service, status, or accomplishments. A title could denote membership in a particular social or political class; participation and status in a profession or occupation; status within a hierarchy; extraordinary achievement in a field of endeavor; or license to exercise certain powers, authority, or functions. During the medieval period, each Italian region and phase of history recognized its own roster of titles. Some of these titles retained older terminology while changing meaning; some remained constant over centuries; and some were regional variations, such as the Venetian *doge*, from the Latin *dux* ("duke"). In general, medieval Italy recognized only two ultimate authorities who could legitimately bestow titles: the emperor and the church. All other authorities—kings, nobles, cities, and universities—derived their authority from these two.

Barbarian societies in Italy had used special labels for warrior leaders, but early on, these societies adopted imperial forms (*rex*, *comes*, *dux*), as the functions and conditions of administration became more complex. Among the Ostrogoths, some of these titles were directly related to the royal court and demesne (*praepositus*, or head of the royal household; *comes rei privatae*, or manager of royal estates); some were related to viceregal administration (*saiones*, or royal vicars of low birth); and some were related to civil and judicial functions (*iudex*).

The interspersing of Roman, Lombard, and later Frankish legal cultures required a new clarity that had to serve until the revival of Roman law in the eleventh century. Lombards retained many Roman-styled officers, including the *decani* and *centenari*, who appear to have been in charge of villages; fiscal officers, such as the *referendarius* and *actionarius*; and ducal (later regal) court functionaries, such as the *maior domus* and *vesterarius*. Under the dukes, the main regional and civic authorities were the *gastaldi*, who often retained their authority under the Franks as well. The Carolingians weakened the autonomous authority of the Lombard dukes, introducing the counts (*comites*, later *conti*) who either served under the dukes or reported directly to the Frankish king.

In Byzantine Sicily, southern Italy, and the exarchate, eastern Roman titles and offices remained intact and often donated nomenclature to later invaders. In Sicily, the titles *catapan*, *strategos*, *logothete*, and

archonte continued in use even during the Norman period. The Arabs, during their 300-year domination of the island, certainly introduced their own officials and titles (*admiral emir*, *cadi*, and the financial official, the *dīwān*) and many of these were also absorbed by the Norman rulers. Under the early Normans, the same official was known as the "emir of emirs" and the "archonte of archontes." Linguistically, the *dīwān* evolved into the *dohana* or *douane*, and in various Romance formulations this term is still used today with regard to customs officials. The feudal Normans, of course, also contributed their own titles, such as seneschal and justiciar, and reintroduced Latin-based official terminology alongside the Greek (Byzantine) and Arab terminology.

Throughout feudal Italy, members of the various classes were designated by official terms of status classification: at the highest level of vassal stood the *capitanei*, who had as vassals the *valvassores*, who in turn subinfeudated their property to the *milites*, or knights. In this system, the relationship indicated by the title was usually sealed with an oath that had both personal and religious connotations.

The Roman Catholic church also developed a broad roster of titles, many with deep roots in imperial Rome. As a hierarchical organization with territorial dispersion, especially in the face of political disarray and outright anarchy, the church also needed as clear a chain of command and duties as possible. Secular titles adopted by the church included *episcopus* ("bishop"), *vicarius*, and "deacon"; the terms "pontifex" and "priest" derived from pagan and Jewish religious offices, respectively. The prefix "arch" before "bishop," "priest," or "deacon" indicated a higher status within the ecclesiastical rank, and generally greater administrative responsibility. The title "cardinal" is really an adjective that denotes a higher rank of bishop, priest, or deacon. The cardinals who were organized into the college of cardinals in the eleventh century were generally cardinal bishops, appointed as such by the popes. The title "pope" (*papa*), for the bishop of Rome, and the use of "father" for a priest evolved from popular usage; and "brother" (*frater*, or *fra*), attached to monastic or later mendicant religious, also evolved over time within the orders. Administrative titles within religious orders, such as "general" and "prior," derived from secular usage.

The revival of urban life and of Roman law in the eleventh century created new opportunities for creating and bestowing titles. Imperial authority to bestow offices and titles had, generally speaking, devolved by usurpation or purchase to civic governments. Bishops in cities often had the political authority of secular counts ("comital" authority), and in 1183 these gained the power from the emperor to invest imperial civic chief executives with the Latin title *consul*. With the eventual triumph of the communal movements in much of northern Italy, this power and title were divorced completely from imperial, feudal, or ecclesiastical authority. Other civic and guild offices with their attendant titles emerged from necessity and the template of the civil law code. A further important step in the development of civic identity and autonomy was the power to create notaries, who could then adopt the title *ser*, and knights (*milites*), who could then use the title *messer*, along with lawyers and properly feudal lords.

Accompanying the revival of towns was the development of the university system. Vital to its identity as a *societas* or *universitas*—a self-regulating association (in this case, of masters and students)—was the right to bestow universally recognized academic degrees and licenses that gave the holders the right to use certain titles (*magister*, *dottore*, *messer*) and to exercise certain functions. This right was contained in its institutional charter, granted by a sovereign authority such as the church, king, or emperor.

Tivoli

Tivoli, 18 miles (about 29 kilometers) east-northeast of Rome, is perched on a spur of the western slopes of the Sabine hills looking out over the Lazio plain. In its deep gorge, the Aniene River curves around the eastern and northern sides of the town, providing both protection and a natural boundary. During ancient times, Tivoli's beauty attracted people who were seeking to retreat from Rome. Remains of numerous ancient buildings dot the surrounding landscape and are incorporated into the medieval and modern buildings. The most famous, the villa of the emperor Hadrian, was built between A.D. 121 and 137 on the site of an older villa.

The town's fortunes were tied to those of Rome during the struggles against the Germanic peoples; Byzantine officials in Ravenna, at the time of the Lombard invasions, recognized Tivoli to be within the jurisdiction of the *ducato Romano*. The papacy, meanwhile, provided an alternative locus of stability and organization; beginning in this period, many monasteries were founded in and near Tivoli, including Santa Maria Maggiore in the fifth century. In the contest for local control and dominance between the papacy, represented by the bishop quartered at the sixth-century *duomo* of San Lorenzo, and the *ducato*, Tivoli pursued its independence. The struggles between the Guelfs and Ghibellines offered it a chance to appeal, successfully in 1155, to the Holy Roman emperor for autonomy. This phase of Tivoli's history is attested to by medieval tower houses, the remains of the walls, and the organization of the town into quarters. When the authority of the Holy Roman emperors in the region declined at the end of the Middle Ages, Tivoli turned to the papacy as its protector.

In the following centuries, Tivoli once more attracted those seeking respite from Rome. The most notable was Cardinal Ippolito II d'Este of Ferrara, who became governor of Tivoli in 1549 and then commissioned the grandiose building and gardens of the Villa d'Este.

Todi

Todi—in Umbria in central Italy—dates at least as far back as the late Roman empire, when it existed as a small community on the Via Veietana, a branch of the Via Cassia. In the fifth century, Todi was already Christian, and—owing to its relative isolation, brought on by the destruction of surrounding communities by Alaric and his hordes—it looked to its bishop as the central authority. The power of the bishop of Todi remained considerable even as Odovacar (Odoacer) brought

Rome to its knees. Under Theodoric's Gothic regime of the late fifth century and the early sixth century, Todi was permitted to retain Roman policy and jurisdiction over civil and administrative matters while the Goths concerned themselves with military issues. As a result, the church was generally free to prosper, as is attested to by the great number of churches established during this period, and the attendant power of the bishop grew even more. The prestige of Todian bishops was further augmented by a sixth-century bishop and saint, Fortunatus (whose death is variously recorded as having taken place in 541, 542, or 565). Many of Fortunatus's miracles, recorded by Gregory the Great, involve distinctly secular issues reflecting the bishop's integral role in Todian political affairs. The Byzantines' victory over the Goths in 553, however, all but eradicated the growing security of the church, and in particular the security of the bishop of Todi. Todi was situated at the heart of much of the fighting, and it also witnessed and experienced much of the famine and pestilence that devastated Italy in the years following the Goths' retreat.

The situation was hardly improved by Alboin and the Lombards' invasion of Italy in 568, for in Todi there was initially no decisive Lombard victory, Todi was seized by Faroaldo c. 579 and switched hands several times before coming under Lombard rule. Probably owing to the instability caused by the discontinuity of administration, not to mention the strife of war, little is heard of Todi during the next century. Yet even in this period, Todi's continued religious focus and its ties to the papacy—in particular the election of Saint Martin, a native of Todi, as Pope Martin I in 649—are documented. This connection was made explicit in the eighth century, when the papacy claimed *plenitudo potestatis* over Todi.

In 760, under the Lombard king Desiderius, the boundaries of the diocese were formalized to coincide with those of the *contado*, again emphasizing the coincidence of ecclesiastical and secular power. The victory of the Franks in 774 and the crowning of Charlemagne as Holy Roman emperor in 800 removed any remaining impediments to the primacy of the popes in Todi, which nominally formed part of the duchy of Rome until the late ninth century. However, Todi, like so many other cities in this period of decentralized power, was essentially independent, and the most notable events under Frankish

administration are rather local—the appointments of various bishops and the founding of a number of monasteries.

In Todi, as in many other Italian cities, the decline in the Carolingian dynasty toward the end of the ninth century brought about the emergence of the great families that would influence civic affairs for several centuries. In Todi, the emergence of the Atti is evidenced by the appointment of one Atto or Attone as bishop in the tenth century. Similarly, the Arnolfi, who would oppose Pope Alexander in 1063, start to appear in the documents around this time. It is reasonably certain that in the mid-eleventh century Todi was under the dominion of Goffredo, the stepfather of Matilda of Canossa. Notwithstanding the position of the Arnolfi, there is no archival evidence suggesting that when Matilda inherited power in 1076, Todi was not faithful to her and her pro-papal policy. In the next centuries, however, these two opposing positions would lead to armed conflict.

The twelfth century saw a significant evolution in the government of Todi. There is some dispute as to the source of its status as a *comune*, but whether the grant was from Emperor Otto I, Emperor Otto III, or Pope Sylvester II, the documents clearly indicate that Todi was a *comune* by the late twelfth century. In 1207, Todi joined several other *comuni* and feudal lords in reconfirming their allegiance to the papacy, but at the same time Todi maintained its right to hear appeals from its own judges without reference to the papal curia. Furthermore, in Todi it was the *podestà* (city magistrate) who presided at heresy trials as defender of the citizens—a privilege that even Venice did not gain until 1289. Occasionally the pope intervened in the life of the commune to mediate between local opposing groups; but more often than not, such mediation was done internally or with the help of another *comune*.

As a *comune*, Todi took a positive and active role in conforming the intimate details of family, social, and economic life to the requirements of community development. Its communal status brought about a new prosperity; and in the thirteenth century Todi sought to expand its control of the surrounding territory. The result was a half century of intercommunal wars between Todi and its neighbors Orvieto, Perugia, Spoleto, and Narni. When Frederick II Hohenstaufen defeated the Lombard communities at Cortenuova in 1237 and then turned to subdue Tuscany and the papal states, Todi readily allied itself with

Perugia, *Foligno*, Gubbio, and Spoleto against this threat. Nevertheless, in the same year Todi tried—though unsuccessfully—to take from Orvieto the territory of Lugnano. That defeat, along with growing power of the Hohenstaufen, led the Todian Ghibellines, the supporters of the emperor, to join in revolt with noblemen of a neighboring ally, Amelia. Todi defeated them, though, at Ponte del Paglia in 1238.

In 1241, after gaining entry to Spoleto and Foligno, mostly through diplomacy, Frederick took Amelia by knocking down the Roman walls, although he did not succeed in taking Narni, Perugia, or Todi. However, when Frederick's opponent, Pope Gregory IX, died in 1241, Todi was led to swear fealty to the emperor. That oath notwithstanding, Todi built a second set of walls in 1244 enclosing the Borgo Nuovo ("new town"), making the town virtually impregnable; and when Frederick left in 1246, the danger of imperial rule passed. By 1256, Todi had succeeded in securing control of the two nearest *comuni* to the south—Amelia and San Gemini—and forcing them to accept Todians as *podesta*. Still, further attempts at expansion proved fruitless.

Though Todi was reasonably well-regulated as a *comune*, it still experienced interfamily disputes among the previously independent feudal lords, who had now moved into the city. Between 1257 and 1269, increasing violence attributed to the traditional vendetta made it more and more difficult for the two consuls, elected by the great council to work in conjunction with the bishop, to keep the peace. To fulfill this task, the great council (consisting of 300 members of the leading families) looked more and more to the *podestà*, who was usually brought in from another community and was therefore, in theory, impartial. With the office came three judges; seven notaries, of whom two served each judge and one was the town recorder; and a number of household retainers. All of them stayed in the *palazzo del comune*. Though the *podestà* was more effective in quelling civic strife, it was impossible to ease the growing tension between the traditionally pro-papal Guelfs and the traditionally pro-empire Ghibellines, which came about when the post-Carolingian emperors found themselves at odds with the church. In Todi, perhaps not surprisingly, the Ghibellines for the most part came from the rural nobility and the Guelfs came from the bourgeoisie. The Ghibellines' victory at Montaperti in 1260 led to a Ghibelline revival; thereafter Todi, which was predominantly Guelf,

introduced a Guelf institution, the office of the *capitano del popol*, and the *anziani*, a council of leading guild members—but neither gained a strong foothold. The *podestà* remained the central authority, although the presumed impartiality of the office seems to have given way to factional allegiance. The office of *podestà* alternated from year to year between Guelfs and Ghibellines, and factional skirmishes erupted throughout the countryside. In 1269, a virtual civil war broke out; as a result, the great council brought in a Guelf *podestà* and passed a series of laws prohibiting bearing arms and holding meetings in churches. A riot broke out nonetheless, after which a Ghibelline *podestà* was put in place. In 1270, the term of office of *podestà* was reduced to six months. The office of *podestà* continued to switch back and forth, and in 1274 two *podestas* were elected, one from each party. But the situation did not improve. In 1275, a law was passed requiring that the *podestà* be elected by an even number from both sides, with the deciding vote going to the bishop if necessary.

Notwithstanding domestic and external strife, Todi achieved the peak of its power in the last half of the thirteenth century. In 1294, a survey conducted for the purpose of taxation shows the *contado* (countryside) extending effectively to Civitella on the west, Collepepe on the north, Castelvecchio on the east, and Castelfranco on the south. Although nominally Guelf (propapal), Todi operated effectively independent of both empire and papacy. Gradually, the *comune* gained sufficient power and prestige so that by the end of the thirteenth century Todi was dealing with powerful nobles such as the counts of Marsciano through negotiations rather than war. Similarly, in 1291 Todi simply bought the fortress of the counts of Montemarte, finally resolving the issues between it and Orvieto. Such newfound skills were essential to maintaining effective independence from papal control—independence that required continual negotiation.

Culturally, thirteenth-century Todi coincided with the poetic tradition of the so-called *siculo-toscani*, and the educated people of Todi would have been familiar with the *stilnovisti* and the courtly poetry of the *scuola Siciliana*. More characteristic of Todi of this period, however, is the extreme spiritualism that swept Umbria in the years after the death of Saint Francis of Assisi in 1226. Following the example of Francis's *Laudes creaturarum* and his invitation to his followers to

become *joculatores Domini*, and spurred on by a prophesy that the year 1260 would bring the age of the Holy Spirit of the Fifth Gospel, laymen throughout Umbria formed groups that specialized in singing poetry of praise known as *laude*. This movement is reflected in the work of Todi's most famous poet, Jacopone da Todi (b. 1236).

Jacopone was a lawyer who had studied at Bologna and was apparently reasonably well off. After his wife died in a tragic accident in the 1260s, Jacopone converted to a life of poverty and charity, living as a mendicant preacher and writing *laude*. In July 1294, the hermit Pier da Morrone was elected to the papacy as Celestine V; he soon abdicated, and Cardinal Benedetto Caetani, who had been educated in Todi, became Pope Boniface VIII. Jacopone, and many other Spiritual Franciscans, struggled to have Boniface removed. Although Celestine died in 1296, this effort continued. On 10 May 1297, Jacopone, along with many other Spirituals and the Colonna cardinals, signed the *Manifesto di Longhezza*, which challenged Boniface's election and called for a general Vatican council. In September 1298, Boniface captured Jacopone and imprisoned him for life in an underground cell in a monastery in Todi. Much of Jacopone's writing, including many of his *laude*, can be traced to the period of his imprisonment.

Boniface died in 1303—greatly to the detriment of Todi. In the absence of the papal protection that had long helped the city maintain its prosperity, internal familial and political discord, along with mounting debts, plunged the *comune* into decadence. In 1306, further conflict with Perugia erupted. The series of wars that followed in the fourteenth century resulted in Perugia's preeminence and essentially precluded any chance of economic or political recovery for Todi. Although the name of the *podesta* elected in 1300 is recorded, the archives in Todi stop shortly thereafter.

Tolomei Family

The Tolomei were an ancient house, in legend descended from the Egyptian Ptolemies but more plausibly traceable to the Carolingian line, although they are documented only from the first half of the twelfth century. They were fundamentally bankers, and during the mid-twelfth century they were one of Siena's five dominant families (the others were the Malavolti, Piccolomini, Saiimbeni, and Saracini). The Tolomei owned tower-houses and palaces in a square which still bears their name and where the thirteenth-century Palazzo Tolomei is a bank to this day. Opposite is the church of San Cristoforo, of which the Tolomei were the patrons; the council of the republic held meetings there before the Palazzo Pubblico was built. The family also had lordships in the Sienese Maremma. Since virtually all the wealth of the Tolomei was invested in France, they were bound to maintain the Guelf alliance.

The family was exiled in 1262–1263 as a consequence of the anti-magnate policy of the *comune* but was readmitted on payment of a large ransom. When the peace of Cardinal Latino (1280) ended hostilities between the Guelfs and Ghibellines, the Tolomei made their own peace with the Salvani. During the Italian campaign of Henry VII of Luxembourg, they and other Guelf families of Siena aligned themselves with the Florentines in opposition to him. A centuries-old

feud with the Salimbeni flared up anew in 1314 and kept the whole city in an uproar between 1320 and 1326, when Carlo of Calabria, Siena's *signore*, imposed peace (as it turned out, only temporarily) on the rival houses. The Tolomei bank was one of many that collapsed in the early fourteenth century, though it recovered and was still prominent in the sixteenth century.

Various family members distinguished themselves in politics, the law, and letters. Meo de' Tolomei (fl. 1279–1310) was a comic poet whose work resembles that of Cecco Angiolieri. The blessed Bernardo (Giovanni) de' Tolomei, founder of the Olivetans (1319), died in 1348 caring for fellow citizens afflicted by the plague.

Tomaso Da Modena

The painter Tomaso da Modena (c. March 1325 or May 1326-c. July 1379) is first mentioned in a Modenese archival document of March 1339. From then until February 1346, his name appears regularly in Modenese documents. A triptych in the Galleria Estense at Modena depicting the *Madonna and Child*, the *Descent into Limbo*, and four saints bears Tomaso's signature and a damaged, repainted date that

may read 1345; it is often regarded as his earliest surviving work. He considered himself a resident of Treviso when he returned briefly to Modena in January 1349 to dispute an estate, and by June he was back in Treviso. His presence in Treviso is documented at close intervals until December 1351, and again in March 1354. The celebrated frescoes in the chapterhouse of San Nicolò in Treviso, depicting forty distinguished Dominicans seated in cells engaged in scholarship, are signed and dated 1352. In the remaining documents, Tomaso is back in Modena: in July 1358, in January 1359, and from June 1366 to March 1368. Then, after a long interval, a Modenese document of July 1379 indicates his recent death.

Two signed works by Tomaso are in the castle at Karlštejn near Prague, which was built for the Holy Roman emperor Charles IV. One of these is a damaged diptych of the *Madonna and Child* and the *Man of Sorrows*, generally dated c. March 1357, when the main portion of the castle was completed. The second work is a triptych of the *Madonna and Child* and two saints: Wenceslas and evidently George (not Palmatius, as was previously thought). This work is in the Holy Cross chapel in the "great tower," which was finished late and consecrated in February 1365. The chapel was apparently decorated by April 1367 by a Bohemian painter, Master Theodoric. Tomaso's triptych was cut down to fit Theodoric's scheme, and its background is entirely modern. It is not known whether it was painted somewhat earlier for another place in the castle and then reused, or whether it was done for the Holy Cross chapel and mutilated after its arrival from Italy, to conform to a new program. In either case, though, there is no evidence that Tomaso visited Bohemia.

The most important of the unsigned and undocumented works that may be attributed to Tomaso are as follows: a pier fresco of saints Jerome, John the Baptist, Agnes, and Romuald, and two donors, in San Nicolò in Treviso, probably painted soon after the chapterhouse; damaged frescoes, mostly from the legend of Saint Ursula, detached from the church of Santa Margherita in Treviso and now in the civic museum, done during his extended stay in that city or during an unrecorded visit shortly after his return to Modena; and the central panel of a triptych, featuring the Last Supper and three Madonnas seen in different settings—reading, nursing, and knitting—in the Pinacoteca

at Bologna, probably painted in the middle to late 1350s. There is general agreement on these attributions, though not on the attribution of the badly damaged frescoes in the Gonzaga chapel in San Francesco, Mantua. In the Gonzaga chapel, Tomaso probably painted the *Life of Saint Louis of Toulouse* and other scenes on the south wall and was not involved in the scenes of Christ on the remaining walls. These scenes of Christ may be attributed to Serafino Serafini, whose arrival in Mantua from Ferrara is promised in a letter of July 1375; the letter seems to provide an approximate date for Tomaso's frescoes as well as Serafino's.

Tomaso probably received his training from his father, who died in 1343 and by whom no paintings are known. At that time Modena was, artistically, provincial, but nearby Bologna had a major painter, Vitale. As early as the Modena triptych (possibly 1345), Tomaso's work shows the influence of Vitale; by this time, Tomaso was apparently an independent painter in Modena. The other major influences on Tomaso were the school of Rimini and the Sienese, particularly Simone Martini. Although Vitale was also influenced by these sources, his art is far more expressionistic, whereas Tomaso's is more realistic. Tomaso's realism is more developed in his frescoes than in his panels. To take the best-known example, the features of the Dominicans in the chapterhouse at Treviso are highly individualized, even by northern Italian standards (which are characterized by less generalization and less idealization than would be found in Tuscany); and the scholarly paraphernalia are minutely observed. No Italian artist of his time comes as close to the art of the northern European Renaissance.

Tomaso influenced Bohemian painting during the last four decades of the fourteenth century. In Italy, his influence was confined largely to his native Modena and to Treviso, where it was superseded around the time of his death by that of Altichiero.

Tommaso Di Sasso Da Messina

The identity of the poet Tommaso di Sasso da Messina (thirteenth century) is unknown; however, his origin in Messina may be confirmed by documentary evidence for the name Sasso in that city. Scandone (1904) found a Thomas Sasus in a list of harbor officials in Messina and concluded that Thomas could very well have been the poet, although Bertoni (1947) considered this identification highly unlikely and Torraca (1902) had uncovered no traces. Tommaso di Sasso's poetic legacy consists of two *canzoni*—*D'amorosopaese* and *L'amoroso vedere*—which are attributed to him by two authoritative codices: Vatican Lat. 3793 and Laurentian Redi 9. Both *canzoni* show Tommaso to be strongly influenced by the Notaro, Giacomo da Lentini.

Torcello

Torcello is an island in the Venetian lagoons north of Murano and of Venice itself, and west of Burano. The island takes its name (according to one explanation) from a small lookout tower that was supposedly there in very early times. According to tradition, Torcello was founded as a settlement in 452 by the population of Altinum on the mainland as they fled from Attila's Huns. In fact, some settlements must go back to the earlier Roman era itself, when there were Roman villas (some of them praised by the poet Martial) on the nearby shore. The first definitive evidence of settlement in Torcello—and, indeed, the first epigraphic document of settlement in the entire lagoon area—is an inscription dated to 639, during the reign of the Byzantine emperor Heraclius, recording the building in that year of its cathedral, dedicated to the Virgin Mary. The settlers were, again, from Altinum; at this time, they were being pressed by the Lombards. Supposedly they brought with them for reinterment the relics of their patron saint, Heliodorus, Altinum's first bishop. They also brought building materials and artistic *spolia* from Altinum, to be reused in their new constructions.

Torcello became a focus of steady population transfer from the mainland into the lagoon area during the eighth and ninth centuries, at a time when the Rivo Alto (Rialto) area—which was eventually to become the Venice we know—had not developed very much. Indeed, as Torcello emerged it continued to rival Venice. Torcello prospered as an active center of maritime trade and in salt production, and it developed a particularly strong woolen industry. At its peak, it was said to have a population of about 20,000, its own episcopal seat, and administrative jurisdiction over surrounding islands. One of the two Venetian merchants who were said to have stolen the relics of Saint Mark from Alexandria was a Torcellan, and local lore insists that Mark's remains were briefly housed on Torcello—where a church of Saint Mark can still be traced—before being transferred to the first San Marco in Venice itself. A tenth-century Byzantine source singles out Torcello as a great trading center within the empire.

By the eleventh century, as Rialto-Venice became more clearly defined, more central, and more self-important, Torcello began a slow

decline. As late as 1247 Torcello had its own *podestà* with a grand council and a lesser council, and in 1464 it was still recognized as a *civitas*; but during the late medieval period its prosperity and population were diminishing. By the fourteenth century, its neglected buildings had become a quarry for decorative materials. Its woolen industry decayed from the fourteenth century on; and during the same period the silting up of its main channel, the Sile, restricted its access to the sea and worsened the problem of malaria. The deterioration of Torcello was signaled by its steady degradation to the status of a local village. In 1689, its bishopric was transferred to Murano; by 1810, its remaining religious institutions were dismantled; and in 1818, it was placed directly under the patriarchate of Venice. The population had been gradually abandoning the island: when the Venetian republic fell in 1797, Torcello had barely 300 inhabitants. The island soon became a collection of swampy gardens and farm fields with few residences. A modest revival was eventually generated, but only for present-day tourist facilities.

Though the remains of a few medieval buildings have been found on the island, the glory of Torcello, and its attraction, is still its small complex of surviving monuments at what was once its civic center. Facing its fourteenth-century municipal buildings (now used as a museum for fragments of the island's lost structures) are two remarkable churches. The smaller of the two is Santa Fosca, built in the eleventh century, perhaps replacing a seventh-century church, intended as a *martyrium* to contain the relics of an early Christian martyr that were transferred to the island. The church is in the form of a Greek cross with short arms within an octagon, surmounted by a circular drum that is topped by a conical wooden roof. No decoration survives in the heavily restored interior, but the bare brickwork presents an elegant picture of structural design; the apse exterior also displays some handsome brickwork patterns.

The most striking monument, however, is the adjacent cathedral of Santa Maria Assunta, whose eleventh-century campanile can be seen like a beacon from many points around the upper lagoons. This cathedral—replacing the one that had first been built in 639 and had been expanded in 824—was rebuilt in its present form beginning in 1008, when Bishop Orso Orseolo, son of the Venetian doge Pietro

Orseolo II, arrived in Torcello. Before its plain facade and a fourteenth- and fifteenth-century portico are the rediscovered foundations of the original seventh-century baptistery. On the outside of the nave may be seen hinged stone slabs that are the shutters of the high clerestory windows, as installed under Orso. The church is laid out on a basilican plan, with a high wooden ceiling, and still preserves Orso's original *opus alexandrinum* marble pavement largely intact. The eleventh-century choir screen and the thirteenth-century ambo (pulpit enclosure) to its left were created out of sculptural fragments from the earlier church—in the case of the ambo, some of them were brutally trimmed for this reuse. The panels mounted over the screen depict the Virgin and apostles; they are by a fifteenth-century Venetian painter. The remounted altar table is set over a Roman sarcophagus supposedly containing the remains of Saint Heliodorus.

Cathedral and Santa Fosca, Torcello. Photograph courtesy of John W. Barker.

In the central apse conch, over the bishop's throne, is one of the church's glorious mosaics, a magnificent representation of the Virgin and Child that is apparently by Byzantine artists, possibly working c. 1185. It is of a Byzantine type called *hodegetria* ("indicator of the way"): that is, with her right hand the Virgin indicates the child, who is on her left arm. Outside the apse arch above her are mosaics (perhaps thirteenth-century) of the two figures of the Annunciation; below her is

a mosaic band (perhaps eleventh-century) representing the twelve apostles. Below that, on the right, the wall preserves fragments of earlier fresco decoration, possibly by Byzantine artists of the late tenth or early eleventh century. Mounted in the wall farther to the left is the restored inscription of 639. In the side chapel to the right of the apse, the conch contains a smaller but also impressive mosaic representation of Christ enthroned between two archangels, in Byzantine style (possibly from the twelfth or thirteenth century), above four saints (possibly from the ninth to twelfth centuries). In the vaulting above, four angels hold the medallion of the mystic lamb (perhaps from the eleventh century), in a style reminiscent of the mosaics of Ravenna.

The most spectacular mosaic in the cathedral, a Last Judgment, occupies the entire interior west wall. The episodes are displayed in a series of descending bands: framed by two archangels, *Christ* rises from the grave in a characteristically Byzantine *anastasis* (resurrection) scene; the enthroned Christ, flanked by the Virgin and John the Baptist in a Byzantine *deisis* scene, presides between two rows of the apostles; angels prepare the throne of judgment (the Byzantine *etoimasia*), before which Adam and Eve kneel, while on either side trumpeting angels summon the dead from land and sea; and an angel and a demon contest the weighing of a soul, while the blessed elect look on in two tiers from one side and on the other side angels herd the damned into hell. In between, in a lunette over the door to the earlier Baptistry, a Byzantine Virgin is shown in prayer (*orans*). This great composition is generally dated to the twelfth century, with some revisions in the thirteenth, plus subsequent restorations.

It should be stressed that all the datings for the mosaics in this church involve conjecture and are disputed, and a definitive investigation has yet to be completed. Nevertheless, these mosaics are magnificent works of art and are also important testimony to the artistic links between Italy and Byzantium in the central Middle Ages. Their study is closely linked to understanding the earlier phases of the mosaic decoration of San Marco in Venice.

Torriti, Jacopo

Jacopo Torriti (fl. c. 1270—c. 1300) was a Roman mosaicist and painter; his reputation today rests principally on two great apsidal mosaics, both signed, in the Roman basilicas of Santa Maria Maggiore (c. 1295) and San Giovanni in Laterano (1291; some sources give 1290 and 1292 as alternative dates). The status of the patron, Pope Nicholas IV (r. 1288-1292), and the highly prominent and prestigious location of the surviving projects confirm that Torriti ranked among the most admired artists of Rome in the late *Duecento*. To judge from the surviving work and from the known artistic commissions of the period, Torriti, perhaps with technical assistance from Byzantine craftsmen, revived in Rome the tradition of mosaic decoration on a monumental scale.

Forriti's mosaic at the Lateran—San Giovanni in Laterano—was

entirely reworked in the late nineteenth century and formed an essential part of a wider program of restoration of this venerated building founded in the Constantinian era. The iconography includes a hovering bust of Christ the redeemer; the cross, from which flow the four rivers of paradise; and a wealth of animal life. All this suggests that Torriti was deeply impressed by early Christian models, and he may have been instructed simply to copy the preexisting fourth-century mosaic design. The latter proposal seems all the more plausible in light of contemporary papal policy: Nicholas IV, like Nicholas III before him, attempted throughout his reign to recover something of the associations of power and splendor of early Christian Rome by redecorating the surviving Constantinian basilicas or by commissioning new works of art in the spirit of the fourth- and fifth century Roman church. However, the inclusion of the principal saints of the Franciscan order—Francis and Anthony of Padua—as well as the Franciscan Pope Nicholas IV would have added a contemporary note to what was ostensibly an early Christian figurative program.

The better-preserved mosaics of Santa Maria Maggiore, which were executed shortly after those of the Lateran, testify to Torriti's consummate skill in the technique of mosaic. The central focus of the design, which rises above a band comprising five *Episodes from the Life of the Virgin*, is a monumental *Coronation of the Virgin* (a recently introduced iconographic type), at the side of which are standing saints, including, once again, Francis and Anthony of Padua; a kneeling Pope Nicholas IV; Cardinal Colonna; and a choir of angels. Much of the upper half of the apse shell is filled with vigorously spiraling scrolls of acanthus that are inhabited by birds. These motifs, together with the river landscape below, are imbued with the spirit of late antique naturalism, and Torriti's design undoubtedly echoes the preexisting fifth-century mosaic scheme, which, according to a lost inscription, Nicholas IV had replaced.

Aspects of the style and iconography of the supporting Marian narratives are closely indebted to rather conservative Byzantine formulas, but the giant Virgin and Christ at the heart of the composition are less so. In these figures, there is a greater sense that the properties of light have been used to define form and texture: from the simple but effective modeling of the faces to the gentle chiaroscuro of

the pliant fabric that falls in voluminous folds over the body of the Virgin, it is evident that both the descriptive and the expressive qualities of light have been exploited. Perhaps as a response to the work of Arnolfo di Cambio and Pietro Cavallini, who were both active in Rome at this time, Torriti's queen of heaven is endowed with a convincing sense of sculptural form. Allied to light is Torriti's play with color: from the subtle shades of ivory and rose of the flesh tones to the dazzling effects of a gold background and the sumptuous contrasts of the red and blue of fabric, Torriti's work offers the highest quality of visual excitement.

Jacopo Torriti (fl. c. 1270-1300), apse mosaic (nineteenth-century restoration).
San Giovanni in Laterano, Rome. Photo: © Scala/Art Resource, N.Y.

Although Torriti signed the Lateran mosaic with, the title *pictor* (painter), no securely documented work by him in the medium of painting survives. On the basis of stylistic similarities with the signed mosaics, however, it has been proposed that he and painters in his direct circle were responsible for a number of frescoed scenes from the Old and New Testaments in the upper church of San Francesco in Assisi (c. 1280s-1290s). Given that Torriti's principal Roman patron, Nicholas IV, had been minister general of the Franciscans and, as the first Franciscan pope, had promoted the shrine of Saint Francis, the proposal

that Torriti might have been involved in the decoration of the upper church is very convincing. Another important artistic project with which Torriti was connected was a mosaic (now destroyed) for the tomb of Pope Boniface VIII (1296).

The prestige of his papal commissions notwithstanding, Torriti is today overshadowed by Cavallini and Arnolfo, who also received prominent projects in the flourishing artistic world of late *Duecento* Rome. Torriti's complex relationship with the art of Byzantium, as well as the survival of signed work in the more conservative medium of mosaic, may partly explain this widespread neglect.

Totila

Totila (d. 552, r. 541-552) is considered the second greatest Ostrogothic king, after Theodoric. Totila led his people during their most severe trials, waging war first against Belisarius and then against Narses. After the capture of Witigis in 540, those representing what survived of Gothic independence rallied to Totila rather than accept the punitive taxation of the eastern Roman victors. Ultimately, Totila was able to reassert the Ostrogoths' control over most of Italy, and he attempted to bring both Italians and Goths under his banner; however, he remained primarily an Ostrogothic ruler.

Totila. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle).

Nuremberg: Anton Koberger, 1493, p. I45v.

There was little respite from the warfare of Totila's reign and its attendant ills. The strains of fighting were combined with pestilence as the first widespread outbreak of bubonic plague struck. Totila besieged and took Rome twice, and although he steadfastly forbade its destruction, this was not true of numerous other towns that were taken and retaken during the protracted struggle. Both sides, desperate for recruits, freed slaves and encouraged desertion among the enemy forces. At one point, Totila manned a fleet to cut Rome off from Sicilian grain. As he pressed the countryside to support his men, the tax system collapsed. Dead bodies could be seen everywhere, and many hostages were taken. However, in 549 Totila gave the last games ever held in the Roman Circus; his coins continued to portray, and his policies continued to reflect, Theodoric's central theme of concord; and he tried to continue regular civilian government.

Totila died fighting in the front ranks at the battle of Teginae (Busta Gallorum) in 552.

THOMAS S. BURNS

Traini, Francesco

The painter and illuminator Francesco Traini (Francesco di Traino, fl. 1321 -1345) is generally considered the most important Pisan artist of the second quarter of the *Trecento*, when Pisa was under the rule of Francesco Novello della Gherardesca. Traini's career is still a focus of debate among scholars, but all would agree that he was one of the most original painters in fourteenth-century Italy. Traini's only surviving signed work is an altarpiece depicting Saint Dominic between eight scenes from his life (1344–1345; Pisa, Museo Nazionale di San Matteo). Since the nineteenth century, this altarpiece has been a valuable point of reference in attempts to identify a larger body of Traini's work.

Documented Life and Career: 1321-1345

Nothing is known about Traini's formative years; but to judge from his securely identifiable work, he was indebted to Sienese artistic traditions, especially the art of Simone Martini and Lippo Memmi, who were both active in Pisa in the early fourteenth century. This debt is evident in Traini's expressive treatment of line, his use of richly wrought surface textures, and his interest in spirited narrative detail. In addition, the Giottesque traditions of Florentine painting in general and the San Torpe Master in particular have been identified as possible sources for the more forcefully expressive elements in Traini's recognized oeuvre. Traini must already have been established as an independent painter with a certain reputation c. 1321, for in July and August 1322 it is recorded that he was paid for having decorated two important rooms in the Palazzo degli Anziani in Pisa. His success during the following decade is indicated by the fact that in December 1337 he committed himself to taking on an apprentice (by the name of Giovanni) for a period of three years. Traini is next recorded in December 1340 and February 1341, when he was involved in a commission to paint a banner for the confraternity of the Laudi of the cathedral in Pisa. In 1344 and 1345, Traini received payment for the signed Saint Dominic Altarpiece, which adorned an altar in the powerful Dominican church of Santa Caterina in Pisa. Albizzo delle Statere, a wealthy Pisan citizen who was active in public life, had allocated funds for its execution in his will of 1336; the status of this commission suggests that Traini's art was held in high regard by his contemporaries. Traini is not thought to have survived the black death in 1348.

Panel Paintings, Frescoes, and Illuminations: 1320s-1340s

The Saint Dominic Altarpiece is considered one of the greatest achievements of Pisan *Trecento* panel painting. It shows a monumental standing figure of the saint, whose solid form is crisply delineated and

defined by robust modeling. At each side of the saint are four episodes from his life, contained within quatrefoils; these are characterized by a remarkably fresh sense of narrative. For example, in one scene—*Saint Dominic Saving Pilgrims from a Shipwreck*—the painter was careful to evoke a variety of responses ranging from a desperate struggle for life by those in the water to the gratitude of the drenched figures who have been saved. Profound insights into psychological nuances and individual characteristics are evident throughout the altarpiece and are a hallmark of Traini's style generally, as can be seen in the *Saint Anne with Virgin and Child* (1330s; Princeton University Art Museum) and the *Archangel Michael* (c. 1330s; Lucca, Museo Nazionale di Villa Guinigi). The *Saint Anne with Virgin and Child* has a highly innovative design: an immobile and matronly Anne with a wizened face is juxtaposed with a suave, youthful Virgin who tenderly supports a lithe and nimble infant. The *Archangel Michael* depicts a heroic figure whose activated pose and spirited drapery convey a powerful sense of energy.

There are still differences of opinion regarding the exact nature of Traini's activity as a fresco painter in the Camposanto of Pisa. Since 1974, when Bellosi attributed the *Triumph of Death* and stylistically similar frescoes to Bonamico Buffalmacco, some scholars have held that Traini's contribution was limited to the bold designs of the Crucifixion (1330s). Traini's career as an illuminator is less contentious, but it too is a subject of divergent critical opinions, which concern the role of collaborators or intervention by a shop. The quality of Traini's illuminations is perhaps best seen in Lucano Spinola of Genoa's copy of Dante's *Inferno* (c. 1330; Chantilly, Musée Condé), which manifests a remarkable sensitivity to glance, gesture, and the fall of drapery.

The legacy of the marked expressive power of Traini's art can be discerned in the work of a number of important younger painters active in northwestern Tuscany. These painters include Francesco Neri of Volterra and Angelo Puccinelli of Lucca, both of whom used Traini's robust chiaroscuro, powerful volumes, and eccentric characterization of figures.

Trani

Trani is a small, attractive city on the Adriatic coast of Puglia between Barletta and Bari. According to ancient traditions, it was founded by a son of the Homeric hero Diomedes, Tirenus, from whom it took its ancient name, Tirenium. However, its actual origins are obscure, and Trani seems to have had little importance or identity through the Roman era, at least until the fourth or fifth century after Christ. In the ninth century, the much older and more important Roman city of Canosa di Puglia was sacked by the Saracens, and its bishopric was transferred to Trani, which also became a stronghold of the Lombard duchy of Benevento.

Trani first came into its own when it became part of the restored Byzantine rule in southern Italy. The Byzantines gave its ecclesiastical life a new, Greek flavor. Above all, taking advantage of the city's

natural harbor and its links with other Adriatic ports, the Byzantines connected Trani's merchants with the marts of Constantinople and the Levant. This gave Trani a new status in international trade from the eleventh century on. Its commercial life was so active that Trani produced, in 1063, the first maritime code created in medieval western Europe, the *Ordinamenta maris*; this was almost two centuries before the celebrated Amalfitan code.

Trani took on further importance when it was annexed by the conquering Normans, under whom it enjoyed liberal privileges and favor. It became a diverse and cosmopolitan community, with colonies of merchants from various other Italian maritime cities, and it cultivated good relations with Venice. Trani reached a peak of prosperity during the reign of Frederick II, who continued earlier patronage and built one of his strong fortresses for its defense. There was also traffic by pilgrims and crusaders; as a port of passage to the east, Trani competed with Brindisi and outstripped Bari. Among the military orders, the Templars made Trani one of their important bases.

With the coming of the Angevins' rule, however, Trani entered a decline. It was battered in the Angevin dynastic wars and was also caught up in a conflict with Venice (1308-1316). There was some revival of prosperity by the fifteenth century, but then Trani found itself caught between the conflicting claims of the Angevins and the Aragonese. The city tried to play a balancing act involving shifting alliances, amid mounting internal dissension and in the face of occasional sieges. Ultimately, it acknowledged Aragonese rule (1435). In 1496, Ferdinand of Aragon, who was deeply in debt, pawned Trani to the Venetians, who ruled it until 1509. When Spanish rule was restored, Trani continued to decay; and in general it did not revive until the twentieth century.

The *centro storico* of Trani, around its port, still preserves much of the city's medieval flavor. The noteworthy monuments include Frederick II's fortress (built in 1233-1249), to the northwest of the port; and, close to the harbor shore, the elegant little Romanesque church of the Ognissanti, which was built in the early twelfth century by the Templars and was a part of their headquarters in Trani until the order dissolved in 1312. Several other small churches received later refurbishing but still retain some of their earlier character. The oldest is

Sant'Andrea (eleventh or twelfth century), built on a Greek-cross plan in Byzantine style with a central cupola. San Francesco was originally built (in 1176-1184) by the Benedictines as a church of the Holy Trinity, but it was taken over in the sixteenth century by the Franciscans and accordingly rededicated. Outside the old city to the southwest is the eleventh-century Abbey of Santa Maria di Colonna, much revised and now a museum.

Trani's most commanding monument by far is its magnificent Romanesque cathedral, which is strikingly situated on the Adriatic shore between the fortress and the port and is one of the finest buildings in southern Italy. It was begun in 1097, on the foundations of a much earlier church dedicated to Saint Mary. The new cathedral was dedicated to Saint Nicholas the Pilgrim, a Greek holy man who fell ill at the earlier church, died nearby in 1094, was canonized two years later by Pope Urban II, and was quickly made the patron saint of Trani. Construction took place in several phases, especially during the twelfth century, and was not completed until the mid-thirteenth century. The exterior of the cathedral is decorated with fascinating sculptures, and an elaborate lion portal on the facade, atop an impressive staircase, frames finely decorated bronze doors (1175-1179) by Barisano da Trani. The interior is, in effect, two churches, one on top of the other. The upper church, the cathedral proper, has been restored to recover as much as possible of its original character. On the lower level directly below the high altar is a richly columned crypt, the original shrine to Saint Nicholas, who is entombed there, replacing the altar and presbytery of the older church. This gives access to the rest of the lower level, directly under the upper nave. Substantially, this part of the lower level is the nave of the earlier church of Santa Maria, which incorporated Roman architectural *spolia* and includes some frescoes from various periods. Below its own floor is the hypogeum of Saint Leucio, an early Christian bishop of Brindisi, whose relics were transferred there for safekeeping in the seventh century.

Transhumance

Transhumance, a form of stock management involving the seasonal movement of livestock to different pastures, was found in medieval Italy on various scales reflecting the social and economic status of the farmer concerned. Contrary to the deterministic views of geographers in the earlier twentieth century, transhumance has never been a result simply of the contrasts of relief characteristic of the Italian landscape.

Although transhumance is likely to be endemic on a small scale in almost any region of Italy, the large-scale movement that involved many thousands of beasts on journeys of hundreds of miles or kilometers did not develop until the later Middle Ages.

The evidence from the early Middle Ages suggests that a wide range of livestock would have been kept in most regions, with an emphasis on cattle (important as plow animals) rather than sheep or, in forested regions, swine. A certain amount of movement of all main types of livestock, including swine, took place, but it was on a relatively modest scale compatible with "normal" farming practices and thus aroused no contemporary comment. In principle, stock is moved off the home farm or out of the home territory only if demand (number of animals) exceeds resources (carrying capacity in the season of shortage). Thus transhumance may be considered a result of bad management (or greed) as often as it may be considered an example of a sophisticated partnership between those having more stock than land and those having more arable land needing manure than animals to provide that vital commodity. The few animals of an individual peasant or farmer in medieval Italy might never have had to be moved at all, being stall-fed (especially during mountain winters) on fodder gathered earlier in the year. Some form of transhumance, regulated by customary or written codes, would have taken place only where either single or aggregated flocks or herds resulted in larger numbers of animals than could be fed locally year-round. Even then, the shorter the distance involved, the better.

In intraregional transhumance, all movement is contained within a community's territorial boundaries, which often ran so as to include both upland and lowland. At Pistoia during the fourteenth and fifteenth centuries, small flocks of 200 or 300 animals were pastured around the city in the winter, manuring the fallow land; and on the rich mountain meadows, less than 13 miles (20 kilometers) away, in summer. Larger flocks—4,000 head or more—had to be sent from the Tuscan Apennines to the coastal marshes of Lucca and Pisa, about 35 miles (50-60 kilometers) away, or even to the thinly populated Maremma of Siena, nearly 90 miles (more than 140 kilometers) distant. Such interregional transhumance involved complicated negotiations with the many communes through which the livestock traveled, as well as negotiations

over the leasing of grass on distant pastures. Farmers undertaking interregional transhumance in medieval Italy were owners of arable estates (lay or ecclesiastical) who were raising flocks and herds to provide the essential draft and manure; butchers investing in cattle (like those of twelfth-century Pisa who had to send their beasts into the Calci hills); or landowners who were in a position to respond to the growing market for wool by specializing in sheep raising, buying more land if necessary, or even promoting enclosure. Much transhumance was operated by each landowner independently. Thus during the eleventh and twelfth centuries, monasteries in the hills around Bergamo (Astino, Pontida, Vall'Alta) were sending stock about 20 to 30 miles (30-50 kilometers) away to spend the winter on the pastures of the Po lowland. But there are also records of "company" flocks, like a flock shared in the late thirteenth century between a family in Pisa (who had it for six months) and the family's partners in the Garfagnana (who had it for the other six months). In regions where the nobles began to specialize in sheep raising, such as Tuscany in the thirteenth century, their feudal prerogative to grant *pascuum* (the right to graze animals on estate land) brought them power as well as wealth. They devolved the obligation of protecting arable land from flocks onto lessees but still charged tolls on flocks moving across, resting on, or feeding from their land. Large-scale transhumance, then, needed financing: shepherds had to be equipped and paid, and money had to be advanced for the hire of distant pastures and for food and tolls.

Such transhumance also needed political stability, and it tended to flourish in a state whose policies were sympathetic to the pastoralists. These conditions were first met in medieval Italy in the Kingdom of the Two Sicilies. Exploiting newly amalgamated territory, Frederick II published a constitution at Melfi in 1231 that not only reestablished something of the old Roman system of transhumance between the Abruzzi and southern Italy (notably Apulia and Basilicata) but also ensured that the state both controlled and benefited from it (through the *fida* or pasture tax). Even so, nothing equivalent to the Castilian *mesta* (1273–1836) existed in Italy before the fifteenth century. Then two major state institutions were created: the *dogana dei pascoli* ("customhouse of the pastures") of the papal states (in 1402), for the wintering of Abruzzi flocks and herds in the Roman Campagna and

elsewhere in Latium; and the *dogana delle pecore* in the Kingdom of Naples (in 1443), for transhumant pastoralism along the eastern side of the peninsula from the Abruzzi southward. The *dogana delle pecore* was strengthened by Alfonso of Aragon in 1447 along Iberian lines to become the central institution for the single most important economic activity of the Neapolitan state: the wool trade. Through this *dogana*, the state controlled a vast network of herding routes (*tratturi*)— the longest journeys covered nearly 500 miles (more than 800 kilometers). The state rented out the extensive winter pastures (*locazione*) of the Tavoliere, and it administered from its base in Foggia all land-use and legal and commercial business. In 1447, the Neapolitan *dogana* already controlled 1.7 million sheep; three centuries later there were 7.5 million.

Translatio Imperii

The term *translatio imperii* refers to a medieval theory accounting for the transfer of the empire of the Romans to other peoples. The concept began to take shape in the patristic age, when ideas about the transfer of power from one people to another articulated by pre-Christian Roman historians were linked with biblical exegesis identifying the Roman empire as the last of the four universal empires referred to in the book of Daniel, destined to survive until the coming of the Antichrist. In succeeding centuries, various ideas were developed to explain the survival of that empire. By the twelfth century, these ideas were distilled into a theory according to which the coronation of Charlemagne in 800 had involved a *translatio* of the unified Roman empire from the Greek Byzantines to the Franks, from whom it passed to the Germans with the coronation of Otto I in 962. Although there were differing views concerning to whom this transfer could be attributed, by the time of Innocent III the papacy claimed to be the effective agency in the *translatio imperii* by virtue of the role played by Pope Leo III in the coronation of Charlemagne. The curial theory prevailed until it was gradually eroded in early modern times in the face of new views of history, political authority, and scriptural exegesis.

Trapani

Trapani, on the extreme western edge of Sicily, is situated amid salt pans at the foot of the great mountain (the medieval Monte San Giuliano) crowned by its neighboring city, Erice. In the Middle Ages, Trapani was a major port linking Sicily to North Africa and to Spain. It was the entry point for the Vandal invaders of Sicily in the fifth century, and it flourished under Muslim rule, as the geographer al-Idrisi attests. Benjamin of Tudela (c. 1160) mentions Trapani as an important source of coral. In the Norman period, Trapani began to function as one of the bases for Genoese and Pisan penetration of the island. The Pisans hoped that, under the terms of their treaties with Frederick I Barbarossa and Henry VI (1162, 1191), they would acquire possession of the city if the Germans captured the Sicilian kingdom; but after Henry VI became king of Sicily, he ignored any such claims. Trapani was a departure point for ships bound on Saint Louis's disastrous crusade against Tunis in 1282 (and also for Charles V's expedition in the sixteenth century); and it was off Trapani that much of the Franco-Sicilian fleet was wrecked on its return. The city supported Peter III of Aragon against Charles I of Anjou in the rebellion known as the Sicilian Vespers; and Peter landed at Trapani in August 1282 on his way to conquer the island, swearing in the city to observe the statutes of his new kingdom. The Angevins were defeated at sea off Trapani in 1284, and an Angevin siege of Trapani was repelled in 1315. As late as 1432, the Angevin claimant to the throne of Naples, Louis III of Anjou, tried to seize Trapani from his rival Alfonso V of Aragon, who, with his customary magnanimity, granted the city the title *invictissima* for resisting.

Trapani had an important Jewish community, living in an area still known as the Via della Giudecca. However, the Palazzo della Giudecca or Ciambra is in fact a sixteenth-century structure, possibly on the site of a former synagogue. About 2,000 Jews were still at Trapani in 1492,

and after the expulsion of the Jews from Sicily that year, many remained as converts (*neofitt*); these included members of the powerful Sala family. The original church of San Domenico stands on the site of a former synagogue, given to the friars by a convert c. 1221. However, the Dominicans moved in 1288 to the present much larger site; there, the tomb of Frederick III's son Prince Manfred was decorated with rich coverings supplied by the local Jews.

The Christian merchants of Trapani were also active; in 1406 there was correspondence between the city council (*università*) and the city of Candia in Crete. The Catalan-Aragonese invasion brought many Catalan merchants to Trapani. A Catalan consul was in the city by 1301 (possibly as early as 1285); by 1345, he had deputies in several coastal ports of great importance in the grain trade, such as Sciacca, Licata, and Marsala. The Catalans and Majorcans appear to have taken over the old "street of the Amalfitans," which became the "street of the loggia of the Catalans" (it is now Corso Vittorio Emanuele). A hospital for the Catalans was erected in 1303. In 1374, the town had 2,608 hearths (i.e., households). Royal privileges were showered on Trapani between 1312 and 1351; these enabled the city to benefit from tax reductions on exports, and exempted Sardinian goods imported by the Catalans from import charges, among other commercial advantages. The monarchy under Frederick III and his successors thus well understood the critical importance of the prosperity of Trapani to the overall well-being of the kingdom.

Trento

Trento, or Trent, is a bishopric and town in northern Italy. Owing in part to its advantageous geographical position in the middle of the Adige valley (in Latin, *vallis Tridentina*), at the confluence of the Sugana and Judicaria valleys, the town was already serving as an important stronghold against invasions from the north in late antiquity. A bishop is known to have been in the Roman *municipium* Tridentum since c. 350. Christian missionary activity had largely been concluded by c. 400, finishing under Bishop Vigilius, the later patron of the bishopric. From the sixth century on, the diocese belonged to the metropolitan see of Aquileia. In 569, the town became the seat of the Lombard dukes, who at times found themselves in conflict with the neighboring Bavarians and Franks but at other times maintained friendly relationships with them. At the time of Bishop Agnellus, whose episcopacy between 577 and 591 is well documented, Abbot Secundus of Trento wrote a historical account, of which only a few excerpts have been preserved by Paul the Deacon. During the Carolingian period new town walls were erected, and the bed of the Adige River, which had been in the process of changing its course, was regulated. There is hardly any documentary evidence of the bishops from the seventh century to the ninth.

The Italian politics of the Ottonian rulers first enabled the bishops of Trento to achieve political importance, largely owing to the geographical position of the Adige valley. Probably, Emperor Henry II, in 1004, conferred the *contado* (countryside) of Trento on the church of Trento and conferred a donation of land in Carniola on the bishop of Bressanone, as a token of recognition for services rendered and in order to secure the route across the Brenner Pass—an important route for the German kings who would journey to Rome to be crowned emperor. In 1027, Conrad II extended the donation to the bishop of Trento to include the counties Vinschgau (Venosta valley) and Bolzano. In making these decrees, the German rulers paved the way for the creation of the prince-bishopric of Trento, endowing the bishops with the necessary authority, i.e., supreme power of jurisdiction in this area.

During the investiture controversy, the bishops mostly took the side

of the emperor. The idea of church reform was introduced by Bishop Altmann (r. 1124–1149), who founded the canonical convent at San Michele all'Adige (before 1145) and the Benedictine monastery of San Lorenzo at Trento (1146). Bishop Adelpret II (r. 1156–1172) was murdered by vassals of his church; he was later beatified. In 1182, Frederick I Barbarossa confirmed the rights of the bishop in relation to the town of Trento and thereby forbade the town to do such things as elect consuls, erect towers or fortifications, or establish weights and measures. All these rights were again conferred on the bishop or the bishopric, and no consul, no count, no *podestà* appointed by the emperor, and no rector would be allowed to contest the bishop's rights. The town was to be governed *sicut et aliae regni Teutonici civitates ordinatae*. Henry VI renewed these comprehensive rights of the bishop in his town of residence in 1191 and prohibited any sort of *coniuratio* or *societas* in the town and duchy of Trento. The massive intervention on the part of Frederick I (1182) and Henry VI (1191) to preserve the authority of the bishops in the face of increasing communal liberties does not, however, allow us to conclude that consular rule following the Lombard model had already effectively been introduced in the town. Their intervention seems rather to have been aimed against attempts (possibly just commencing) to introduce consular rule. Still, during the first years of the thirteenth century the citizens of Trento were actively participating in the more important decisions of civic life. Furthermore, their powers were being extended beyond the confines of the town, so that the town inhabitants stepped in as a decision-making body alongside the cathedral chapter and the *curia vassallorum*. Thus there were undoubtedly communal elements in Trento; what was missing was an effective alignment of organs of communal self-government.

The economy experienced an upswing from the twelfth century on; this involved an increase in trade and traffic along the Adige, silver mining, and coin minting. From 1185 to 1214, we possess copies of documents relating to mining rights in the area of Monte Calisio north of Trento, where silver ore was exploited. They contain provisions for the so-called mining liberty and for hereditary mine shafts; further technological, social, and legal innovations; and the oldest European mine regulations, dating from 1208.

Bishop Frederick of Wangen (r. 1207–1218), who was the uncle of

Count Albert of Tirol and was related to the house of Hohenstaufen, proved to be extremely clever and energetic. He succeeded in having the regalia confirmed by all the emperors who reigned during his tenure of office. In addition, he had the rights of the Trento church documented in an extensive collection of deeds, and in 1213 he was named imperial legate and vicar by Emperor Frederick II. The bishop also had a new town wall built and began the rebuilding of the late Romanesque cathedral. In the first decades of the thirteenth century, Franciscans (c. 1221), Poor Clares (1229), and Dominicans (1235) settled in Trento. In 1250, building started on the *castello* Buon Consiglio, the bishop's fortified residence at the edge of the town.

Presumably mostly for strategic reasons, in 1236 Emperor Frederick II forbade Bishop Alderich to exercise any secular powers and appointed an imperial *podestà* in Trento. The last and most influential of these podestas was Sodeger de Tito, who managed to maintain his position in Trento after Frederick II's death. After 1250, Sodeger received increasing support from Ezzelino da Romano, with whom he had seigneurial ties. In 1255, however, their cooperation came to a halt, the town of Trento having broken with Ezzelino in the spring, and no further mention is made of Sodeger as *podestà*.

Count Meinhard II of Tirol (1259-1295), taking advantage of the fact that his ancestors had been serving as bailiffs of the Trento region since 1150, seized from the bishops much of their means of income and rights, so that the territory the bishops were in the process of creating was limited to the southern part of the episcopacy. From c. 1300 on, the confluence of the Avisio and Adige rivers (about 3 miles, or 5 kilometers, north of Trento) constituted the boundary between the bishopric of Trento (belonging to the *regnum teutonicum*) and the county of Tirol. In addition, the Tirol territorial princes—particularly the Hapsburgs, who began to rule in Tirol in 1363—exercised enormous influence on appointments to the bishop's chair. Through contractual agreements, these princes also achieved decisive military power within the area of the bishopric, which was threatened from the south by the Scaliger (della Scala) family and later by Venice.

Duomo and fountain, Trento. Photograph courtesy of Christopher Kleinhenz.

The Venetians began to force their way into the Adige valley at the beginning of the fifteenth century; in 1416-1417, for example, they took the castle and market town of Rovereto in the Lager valley by force. This had a stimulating effect on Rovereto, which then served as the administrative center of Venetian rule in this area and as a well-fortified military bastion; it remained part of Venetian territory until 1509. Trento's participation in the Falcon League—a pact formed in 1407

by more than 120 members from all parts of Tirol to protect the interests of the nobility—took place during turbulent developments in the bishopric. Bishop George, from the Moravian line of the Lichtenstein family, had attempted to consolidate his position inside and outside. The measures he took to this end—in particular, the fact that he brought counselors and retainers with him from his home country—provoked a revolutionary uprising of the nobility against him in 1407. The Hapsburg duke Frederick IV supported the uprising. However, although the prince and the apposition in Trento had initially been linked by common interests, this tie soon weakened. Rodolfo Belenzani, who rose to the post of *capitano del popolo* of Trento, was seeking an opportunity to extend the authority of the civic bodies over the entire bishopric. In the ensuing struggles against the Tirolean troops, Belenzani met his death in Trento, and Duke Frederick eventually took over the administration of the whole Trento area.

During the episcopacy of Bishop John Hinderbach (1405-1486), there was a sensational court trial involving the Jews of Trento, who were accused of the ritual murder of a two-year-old Christian boy, Simon Unverdorben, on Maundy Thursday in 1475. The accused confessed under torture, and fourteen Jews were condemned to death. Although the highest-ranking church officials were reserved about the case, the cult of the presumed victim spread rapidly, encouraged by the bishop himself. The cult was also promoted by book printing; the earliest product of this technology in the old crown territories of Tirol was *Geschichte des zu Trient ermordeten Christenkindes* (*Story of the Murdered Christian Child from Trento*, 1475).

The famous Trent Codices were arranged during the same period. These codices reflect the polyphonic repertoire of churches and court orchestras in southern Germany and northern Italy (and perhaps the repertoire of the imperial court as well) between c. 1400 and 1475. They contain mostly anonymous music, but also harmonies by Dufay, Binchois, and Ockeghem; pieces by composers from Italy (Zaccaria da Teramo) and England (Dunstable, Power); and German works. The manuscript was presumably not intended for practical use, since it is small (about 12 by 8 inches, or 30 by 20 centimeters) and completely mixes the genres. Rather, it reflects the findings of an ardent humanist collector, who may have compiled the repertoire especially for Bishop

Treviso

Treviso, a town north of Venice, is situated in the Veneto plain only 49 feet (about 15 meters) above sea level, at the confluence of the Sile and Botteniga rivers, which are more like two canals running on the flanks of the city. As it enters the city, the Botteniga divides into three canals: the Roggia, Buranelli, and Cagnan.

Treviso was founded as a municipality by the Romans under the reign of Claudius as Tarvisium, on the site of a former Veneto-Gallic settlement. Its links with Christianity are traced to Saint Mark, who is reputed to have traveled to Treviso from his seat in Alexandria to convert the residents to Christianity. By the third century, Treviso had become the location of the council of bishops of upper Italy and Istria. In the sixth century, it was the seat of a Lombard duke, Oderzo, an Arian, at which time the bishop moved to Torcello. Charlemagne made Treviso capital of a marquisate (c. 798). When the Carolingian empire collapsed, the Hungarians invaded northern Italy in 898 and again in 911. In 1116, Emperor Henry V came to Treviso; he was followed by Frederick I Barbarossa in 1157. In opposition to these German

incursions, Treviso joined the *lega* Veronese, along with Padua, Verona, and Venice; this alliance later became known as the Lombard League, which was united against the German Holy Roman emperor. Treviso became an independent (free) town after the peace of Constance (1183), and its communal period lasted until the late thirteenth century.

Together with other cities in the Veneto (Vicenza, Verona, Padua), Treviso was ruled by the Ghibelline tyrant Ezzelino III da Romano, who died in 1259. Ezzelino's brother Alberico, who had also made Treviso his seat of operations, was, together with his entire family, captured and put to a horrible death (an extant fresco in Treviso depicts these events). Near the end of the thirteenth century (1283-1306), Treviso achieved its cultural high point under the rule of the Guef Gherardo III da Camino, whom Dante praises in *Purgatory* (16.124) as *il buon Gherardo*. The rule of the da Camino family ended in 1312, when the counts of Gorizia came to power. The city then came under the protectorate of the bishop of Venice, which lasted until 1328. In 1318, a university was founded in Treviso by the Venetian bishop, who was also its governor. From 1329 to 1339, Treviso was subject to Verona, having been conquered in July 1329 by Cangrande della Scala, who died shortly thereafter (on 29 July). He was succeeded by Mastino II and Alberto II, the sons of his brother Alboino. In 1339, Treviso once again came under the control of Venice, where it remained for many years. Like other European cities, Treviso was struck by the plague in 1348 and again in 1371.

The cathedral of Treviso, dedicated to Saint Peter, was founded in 1141 and restored in the fifteenth century. Its crypt still retains the original Romanesque structure. The Romanesque church of San Nicolo contains a fresco of the Crucifixion which blends Romanesque and Gothic styles. The Romanesque baptistery dates from this early period, but the largest number of works of art surviving in Treviso date from the Gothic period.

Medieval Treviso reveals a renewed civic identity with the crenellated Palazzo dei Trecento (begun in 1207) and the similarly designed Palazzo del Podestà (1218–1268), followed by the important addition of the Torre del Comune. The Loggia dei Cavalieri was begun during the rule of Giacomo of Perugia (1276-1277) and was intended as an atrium in the Byzantine manner for the "solace of the nobles"; it was completed in 1314. The Loggia was constructed of Istrian stone, a

common building material used in Treviso and in other towns in the Veneto. The Biblioteca Capitolare, which dates from the twelfth century, has a rich collection of manuscripts and materials pertinent to the religious and civic history of the city. The church of San Francesco is the burial place of Dante's son Pietro (d. 1364) and Petrarch's daughter Francesca (d. 1384).

Treviso presents a mix of styles reflecting several factors: its strategic position for travelers across Italy and for visitors to Venice, influences from the east, and commerce and travel over the Alps. The two major influences were the Byzantine east and the Lombards. Nowhere is this merging of styles more apparent than in domestic architecture and in the pictorial decoration of houses, some of which are as early as the eleventh century. Treviso was once as colorful as Venice, with numerous houses featuring painted facades, inner courtyards, and private chambers. Although most of these were built during the thirteenth and fourteenth centuries, the tradition continued well into the eighteenth century.

The Dominican church of San Nicolò was celebrating the divine office as early as 1231, but the present church was constructed between 1310 and 1352, as was the church of Santa Lucia. Santa Lucia still contains the fresco of the *Madonna delle Carceri* by Tomaso da Modena, the leading painter of Treviso in the second half of the fourteenth century. Other frescoes represent the events of Holy Week and the lives of saints James and Christopher, both patron saints of travelers and pilgrims. For the former monastery of San Nicolò, Tomaso da Modena also painted a series of frescoes of famous Dominicans in the Chapter Room (1352). Tomaso's compartmentalized and detailed style is thought to have influenced Jan van Eyck, who came to Italy in the early fifteenth century. Fine works from the Gothic period can be found in the Museo Civico; all these suggest a prosperous and dynamic community in the thirteenth and fourteenth centuries.

Tristan

The Celtic legend of Tristan was widely diffused in England and France by the end of the twelfth century. It centers on the love of Tristan for Isolde, the wife of his uncle, King Mark. In its many rewritings and retellings over the centuries, the basic story of the love triangle has been embellished with a wide variety of episodes that include love potions and duels as well as the lovers' ostracism and eventual death.

The legend seems to have made its first full-fledged appearance in Italy in the *Tristano Riccardiano* (c. 1272-1300), a not overly imaginative compilation of previous texts about Tristan composed in the French and Iberian traditions. The fundamental elements are all present in this prose work, but what is left of it abruptly comes to a close before Tristan's death. Its widespread and immediate popularity is confirmed by the abundance of extant versions of the work and by the many pictorial representations that had been commissioned by the beginning of the fourteenth century. There is no shortage of allusions to the love affair of Tristan and Isolde—or to episodes commonly

associated with it—in medieval Italian literature in general (e.g., Giacomo da Lentini's *canzone Madonna mia a voi mando*, the fifth canto of Dante's *Infemo*, and several tales in the fourth day of Boccaccio's *Decameron*). However, integral versions of the legend are comparatively few. The *Tristano Riccardiano*, together with the stock versions in Old French, served in part for a more comprehensive adaptation of the Arthurian cycle in the anonymous *Tavola ritonda* (c. 1325—1350), a much more inventive combination of inherited plots told in an interesting and original manner. Additional, though less influential, compilations written in this period include the *Tristano Panciaticiano*, the *Tristano veneto*, and the *Tristano corsiniano*.

Alongside these written versions, there were also oral renditions: these are the so-called *cantari*, which were intended for listeners. We have very little way of knowing just what the content of these performances originally was. The poems have survived, in large measure, in the forms given to them by fourteenth and fifteenth-century transcribers. Generally speaking, the verses deal with single episodes of the legend of Tristan, such as his birth (recounted in the *Cantare dei cantari*), his various single adventures (*Tristano e Lancielotto al Petrone di Merlino*, *I cantari del falso scudo*, etc.), and his death (*Le ultime imprese e la morte di Tristano*).

Trotula of Salerno

Trotula is the name given to a number of medical treatises on the diseases of women, most of which seem to have come from the medical university of Salerno. Whether a twelfth-century Trotula of Salerno actually existed, whether Trotula was a woman, and what and for whom Trotula wrote have been a subject of scholarly debate for many years. Benton (1985) suggested that a female physician named Trota

wrote a *Practica* (*Practice of Medicine*) containing obstetrical and gynecological material while teaching at Salerno. Unlike many other universities in the Latin west, Salerno was formed by a community of medical practitioners who were not necessarily clerics; this anomaly would probably account for the remarkable presence of a woman teacher. The *Practica*, in Latin, was not copied after c. 1200; it was supplanted by other Latin works on gynecology and cosmetics taken from various male writers. The name Trotula (probably a diminutive of Trota) was attached to these later writings, which were in turn translated into a number of European vernaculars. Benton held that the genuine writings of Trota were more practical in character than those of her fellow Salernitan physicians, but this conclusion is difficult to support.

Troy, Legend of

Although Petrarch had Homer's *Iliad* translated into Latin in 1354, the

vast body of medieval literature related to the fall of Troy does not stem from Homeric roots. The knowledge of the Trojan war that passed from generation to generation goes back ultimately to two chronicles that were thought to be authentic eyewitness accounts of the ten-year battle. These are the *De excidio Troiae historia* of Dares Phrygius and the *Ephemeris de historia belli Troiani* of Dictys Cretensis. Dictys's work was originally composed in Greek around the first century after Christ; but it circulated widely in its Latin translation, which dates from about the fourth century. There is no extant Greek version of Dares's text, though it is commonly believed to have been composed at roughly the same time. Its Latin translation, of which several copies survive, was finished around the turn of the sixth century. Both works are poorly written; remarkably, however, both were greatly respected by medieval writers as genuine factual documents, and they provided the principal sources for subsequent historical and literary compilations. Dictys, whose narration is from the perspective of the Greeks, was more popular in the Byzantine east. Dares, the more synthetic of the two, told of the war in pro-Trojan terms and was exceedingly well received in western Europe, where several national mythologies, including that of Italy, credited the Trojans with the founding of their nations and principal cities. The two narratives are relatively free of fantastic events, such as the intervention of the gods in battle; and it is probably due in part to this characteristic that medieval readers gave so much credence to their first-person claims to veracity.

In the twelfth century, there appeared in France more modern" tellings of the legend of Troy: the *Roman de Thèbes*, the *Roman d'Enéas*, and the very famous *Roman de Troie*, written c. 1160-1170 by Benoît de Sainte-Maure. Benoît's version was certainly the most widely known of the three and the most influential in Italy. It was based loosely on the works of Dares and Dictys, with, however, a significant addition of events inspired by the Old French romance tradition. New to the legend are innovative love stories (from which developed the tale of Troilus and Cressida), detailed descriptions of exotic people and places, and a general indulgence in authorial imagination. The *Roman de Troie* was quite popular in Italy from about the beginning of the thirteenth century on. The literary tradition blossomed in Sicily with Guido delle Colonne's completion of the *Historia destructionis Troiae* c. 1287 for the

bishop of Salerno. Essentially a prose translation in Latin of Benoît's lengthy poem, the *Historia* is still told in the *roman degeste* style but is addressed to a more learned public and contains quotations from Virgil and Ovid as well as moral and philosophical commentary. Its success throughout Europe was unprecedented, and it is the chief source for many of the subsequent European versions of the legend of Troy. Guido never explicitly mentions Benoît by name but does cite Dares and Dictys on several occasions in an attempt to lend an air of accuracy to his history. During the fourteenth century, a number of vernacular translations of Gui-do's *Historia* appeared throughout Italy. The most important are those of Filippo Ceffi (1324) and Mazzeo Bellebuoni (1333) in Tuscany; an anonymous Sicilian version (of uncertain date); a Neapolitan translation; and the rather popular *Libra chiamato Troiam*, a Venetian version that combined the work of Guido with tales adapted from French romance. In addition to these, numerous dialect versions of vernacular translations, whole or partial, were commonly found in almost all regions of Italy.

Allusions to Troy and the Trojan cycle appear in Brunetto Latini's *Tesoro* (1.32), the *Conti di antichi cavalieri* (*conto de Agamenon*), the anonymous *Novellino* (13), Ser Giovanni Florentine's *Pecorone* (15.2), and the works of chroniclers such as Rjcordano Malispini and Giovanni Villani. Alongside the prose renditions of the legend there also existed several in verse, which gave rise to a large part of the medieval oral tradition. The rich legacy of the legend of Troy was enhanced in the work of later authors by the "rediscovery" of Virgil, Livy, and other classical writers. Dante utilized several episodes, including the destruction of the city (*Purgatory*, 12.61; *Monarchia*, 2.3), Aeneas's arrival in Italy (*Inferno*, 1.74; *Convivio*, 4.5), and the ruse of the wooden horse (*Inferno*, 30.98-129). Giovanni Boccaccio made an enduring impact on European literature with his retelling of the story of Troilus and Cressida in the *Filostrato*.

Turin

Turin—in Italian, Torino—is in northwestern Italy, on the Po River. The ancient Roman city of Augusta Taurinorum (a name derived from

Taurasia, principal city of the Taurini) was situated at the confluence of the Doria Riparia and the Po and was the most important convergence of land and water routes south of the Alps. It remained a major military point throughout the Roman era.

The first recorded bishop of Turin was Saint Maximus in 415. The position of importance implied by a bishopric continued into the early barbarian period. In 569, after the fall of Milan, Turin came into the possession of the Lombards; it was in turn a Byzantine and a Lombard duchy, a status corresponding to its importance as a major ecclesiastical center. In the late eighth century, both Pepin and Charlemagne seized Turin, which became the seat of a Frankish duchy. The city was contested by Guido of Spoleto and Berengar of Friuli, among others. Around 940, King Hugh of Aries established a follower, Arduin, as count of Turin and founder of a dynastic regime dominating the surrounding region as a sort of marquisate. Under these dynasts and in collaboration with the powerful bishops of Turin, the region enjoyed considerable prosperity despite attacks by the Magyars and the Saracens.

Around 1097, Umberto II of Savoy assumed the title of count and marquis, but he was unable to take direct control of the city. With the support of German emperors, the population of Turin mounted opposition to the rule of the Savoy family, and this struggle dominated most of the twelfth century. In 1155, Frederick I Barbarossa granted to the bishop recognition of seigniorial rights, striking a severe but not fatal blow at the hopes of the Savoy family. For a while, Count Umberto III was able to win Frederick's favor, but this failed to win him control of the city. After the peace of Constance (1183), Frederick renewed his support of the populace and recognized the episcopal control of the city. After 1190, Henry VI renewed the effort to establish imperial control; he imposed his own *podestà* on Turin, thereby curtailing the bishop's authority and encouraging greater assertiveness by the commune.

In 1210, Tommaso (Thomas) I of Savoy supported Emperor Otto IV against the claims of Frederick II. In response, in 1218, Frederick II recognized the bishop as his imperial vicar, thus checking the ambitions of both the count and the commune. Tommaso I initially persisted as an opponent of Frederick II, but in 1226 submitted to the emperor, who made him imperial vicar in Italy. Turin itself joined the second

Lombard League. In 1235, after long struggles, the city of Turin made peace with the count of Savoy; but following the battle of Cortenuova, Frederick II established his own regime in the city, which ruled harshly until 1247. Frederick II was in residence in Turin for some time, and during that period Pope Innocent IV excommunicated the popular regime for refusing to accept the bishop whom he had designated. Pressed by his difficult situation, Frederick II moved to accept the house of Savoy in the person of Tommaso II, to whom he granted Turin as a fief. Tommaso II secured the city in 1251, following Frederick's death, and after a reconciliation with Pope Innocent IV was granted papal confirmation in 1253.

Conflicts with neighbors prompted an expulsion of Savoy rule in 1255 and the reestablishment of a free commune, which became dependent first on the neighboring city of Asti and then on Charles of Anjou. In 1276, it fell under the control of Marquis William VII of Montferrat, who was, however, forced to yield the city in 1280 to Tommaso III of Savoy. Tommaso III succeeded in establishing secure relations with the commune, recognizing its internal autonomy to some degree. Under his successors, this autonomy was further consolidated as the counts established their residence in Pinerolo. In 1334, Theodore Palaeologus of Montferrat was briefly admitted to the city. Turin became the focus of a bitter struggle between rival branches of the house of Savoy. Filippo of Savoy, claimant to the title of the Greek principality of Achaia, and his descendants were opposed by Amadeo VI, who was called *conte Verde* ("Green Count"). Amadeo seized control of Turin and other important points in the Piedmont and reestablished good relations with the city by renewing communal rights. He then established Giacomo of Savoy-Achaia as his vassal and dependent in the city. After Giacomo's death, Amadeo presided as regent during the minority of Giacomo's sons. In 1381, Amadeo convened in Turin a peace conference that represented his supreme triumph as a diplomat and as a mediator between warring Venice and Genoa. With the extinction in 1418 of the Savoy-Achaia line, Amadeo VI's descendant, Duke Amadeo VIII, completed the unification of the family's regime in Piedmont. Six years later, Amadeo VIII assumed the title of prince of Piedmont, with his residence in Turin.

Only a few small fragments of art survive from the medieval city. In

a special chapel of the cathedral built by Guarini in the late seventeenth century, the famous shroud of Turin is preserved.

Turin, Shroud of

The shroud of Turin is probably the most famous and certainly the most controversial relic currently in the possession of the Roman Catholic church. This remarkable object, a cloth bearing frontal and dorsal images of a male human body apparently afflicted with the physical injuries commonly associated with crucifixion, has been venerated at Turin since 1578. Believers regard it as the shroud in which the body of Christ was wrapped, after his crucifixion, by Joseph of Arimathaea, as described in Matthew's Gospel (27:59); skeptics see it only as an admittedly extraordinary piece of devotional art; for many others, the debate remains unresolved.

The shroud is not convincingly reported anywhere before the fourteenth century, although it has been speculatively identified with the Edessa *mandylion* (mandil, or scarf), whose presence at Constantinople is attested to in 944. Scientific tests, including radiocarbon dating, carried out in the 1980s suggested that the cloth of which the shroud is made was produced in the thirteenth or fourteenth century. These conclusions are far from universally accepted (though

the church has tended to discourage what it sees as undue attention to the shroud in recent years); and even those who see the relic as originating in the Middle Ages must still account for the astonishing technical virtuosity and anatomical knowledge that would have been required of its putative maker—neither of which is significantly paralleled in other artworks of the period.

U

Ubalдини Family

The Ubaldini lineage was one of the oldest and most prominent Ghibelline houses in the Florentine countryside (*contado*). Family members first appear in documents from the eleventh century as proteges of the bishop, the margrave, and the Guidi. Like the Pazzi of the Arno Valley, the da Sommaia, and the da Gangalandi, the Ubaldini played only a minor role in Florentine urban public life. They possessed extensive landed holdings and castles (*castelli*) in the western Mugello, the lush Apennine valley north of Florence. Many of these possessions were originally imperial grants, such as their investment of land by Frederick I in 1184 in the Mugello.

Throughout the twelfth, thirteenth, and fourteenth centuries, the Ubaldini were consistently hostile to Florentine political and military interests in the Mugello. Like the Ubertini and Pazzi of the Arno Valley, they often disrupted commercial traffic to and from the city and controlled strategic arteries linking Florence with the Romagna. For those reasons, after the mid-thirteenth century the Florentines attempted to limit the domination of the Mugello by the Ubaldini, if not end it altogether by military means. In the Ordinances of Justice of 1293, the Ubaldini appeared on the list of magnates of the *contado* declared ineligible to hold major public offices in Florence. The Ubaldini were sympathetic to the White Guelfs; and they continued to obstruct the free flow of grain traffic from the Romagna into the city in the early fourteenth century. In 1306, the Florentines razed the Ubaldini stronghold at Montaccianico in the Mugello, establishing Scarperia and Firenzuola as new towns (*terre nuove*).

Ottaviano degli Ubaldini (d. 1272), cardinal and bishop of Bologna, appeared in Dante's *Inferno* (10.120).

Uberti Family

The Uberti clan of Tuscany was one of the region's oldest noble families, and by the twelfth century it was the leading noble family of Florence. Because of their strict noble attitude, the Uberti, as a family, never participated openly in the commercial success of the city. The Uberti were staunch supporters of imperial interests, and in 1177 they struggled with the Giandonati family for influence with the emperor Frederick I Barbarossa, and for control of the communal offices in Florence. This three-year struggle ended with the institution of the *podestà* in Florence, and an agreement to share civic offices.

The murder of Buondelmonte de Buondelmonti by Schiatta Uberti in 1215 divided the city for the first time between the Guelfs, supporters of the Buondelmonti family and of papal interests; and the Ghibellines, who were pro-imperial and were led by the Uberti. The feud between the Uberti and the Buondelmonti lasted into the fourteenth century, although there were several attempts at reconciliation through intermarriage. In 1247, after Emperor Frederick II made his son Frederick of Antioch vicar-general of Tuscany, Florentine Guelfs battled the Uberti, who were ensconced in their urban strongholds. The Guelfs were driven from the city, and some thirty-six of their family towers were destroyed by the victorious Uberti and their followers.

With the death of Frederick II in 1250, Florence established a popular government. The Uberti openly opposed this in 1251 and were exiled for a year. The imperial coronation of Manfred (Frederick II's natural son) in 1258 once more emboldened the Ghibellines, and an attempted coup led to exile yet again. The Ghibelline exiles joined with the Sienese and imperial army that defeated the Florentine Guelfs at Montaperti in 1260. The Guelfs fled Florence, and the victorious Ghibellines proposed the total destruction of the city. Farinata degli Uberti (d. 1264) defended his *patria*, and the proposal died. (See Dante, *Paradise*, 16.109 ff.; *Inferno*, 6.79-87, 10.16-18, 22 ff.) After Manfred's defeat and death at Benevento (1266), the Guelfs regained control of Florence and promptly razed the possessions of the Uberti. Much of the rubble was left untouched for a decade, a symbol of the family's destruction. Since

most of the Uberti refused to return to Florence (or were not allowed to return, according to Villani), the commune retained the property, on which were built Le Stinche prison, Palazzo Vecchio, Piazza Signoria, and, later, the Uffizi. Branches of the Uberti family relocated to Cremona, Mantua, Venice, and Verona.

Ubertino Da Casale

The Franciscan reformer ubertino da Casaie (1259-c. 1329) was the author of the *Arbor vite crucifixe Jesu*—sometimes translated as *The Tree of the Crucified Life of Jesus*. This work had a strong effect on later Franciscan rigorists and on some prelates ind monarchs; figures who were influenced by it include Dante, Giovanni dalle Celle, Saint Catherine of Siena, Saint Bernardino, John Brugman, and King Martin I of Aragon.

Most of our information about Ubertino until the time when he composed the *Arbor vite* in 1305 comes from its first prologue, but its chronology is not always clear. Ubertino was a native of Casale Monferrato in the diocese of Vercelli and in the Franciscan province of Genoa. He was received into the Franciscan order (Friars Minor) at age fourteen. Scholars disagree about the next period of his life. Some think that he remained in his province for a considerable time, until c. 1284 or 1285; but others—on the basis of his own testimony that he studied for

nine years *et Parisius fui*—believe that after his novitiate he went to Paris and remained there until c. 1284. In any event he spent the years 1285 to 1289 (dates on which all the scholars agree) at Santa Croce in Florence. There, he was probably a subordinate lector in its *studium*, since he says that he was occupying the office of lector when he heard, at Pentecost, of John of Parma's death, which occurred in March 1289 (*Arbor vite*, 5.3).

It seems likely that Ubertino's studies in Paris had preceded this period in Florence rather than that, as some scholars hold, he went to Paris only after 1289. Ubertino associates Paris with a time when he was lax and ambitious. He tells us that his coming to Tuscany was accompanied by a conversion to a more ascetic life. Half of his four-year stay in Florence coincided with the lectorate there of the reformer who was to have the greatest influence on him, Petrus Johannis Olivi. Ubertino would have been exposed to Olivi's doctrine of *usus pauperi*, or "poor use," as essential to the Franciscan way of life—that is, the austere use of necessities and the avoidance of economic security and all superfluity. He must also have heard Olivi prophesy the persecution of the "spiritual" church by the "carnal" church. Ubertino's first meetings with Olivi—and with Margaret of Cortona, Cecilia of Florence, and John of Parma (who was in retirement at Greccio)—must have taken place just before or during 1285–1289. His crucial encounter with Angela of Foligno may also have been at this time. (There is conflicting evidence in the manuscripts on the date of this meeting: some say "in the twenty-fifth year of my religion.") According to Ubertino, these were the meetings that brought about his real conversion, after "almost fourteen years of external observance." It is difficult to believe that he then relapsed into what he calls laxity and ambition.

Ubertino learned a great deal from Olivi at Santa Croce; but unlike Olivi, he had no vocation to be a professional theologian, or to continue as a lector. Instead, Ubertino abandoned teaching to become a wandering preacher, traveling through Tuscany, Umbria, and the Marches, and denouncing both the heresy of the Brethren of the Free Spirit and the corruption of the official church. It is clear from the *Arbor vite* that he considered the resignation of Pope Celestine V and the subsequent election of Pope Boniface VIII illegitimate—a point on

which he differed from Olivi. In the *Arbor vite* he identified Boniface, as well as Boniface's successor Pope Benedict XI, with the mystical Antichrist. How far Ubertino went in expressing these radical views in his public sermons is uncertain, but some hint of his opinions must have reached Benedict XI, because the pope summoned and arrested him. Ubertino was freed only because of the entreaties of a delegation of Perugian citizens; he was then sent by his Franciscan superiors to La Verna for an extended period of meditation. He used that time to write the *Arbor vite*, although he can hardly have composed the whole artful and almost interminable work, as he avows, in three months and seven days in 1305, without premeditation and with the aid of just a few books. Perhaps he was referring only to the nucleus of this vast work—a conjecture that might explain how Angelo Clareno could have described it as a "small" book. In any case, the more extreme opinions in the work were evidently not known to Ubertino's enemies among the Friars Minor for a long time, for they attacked only his defense of Olivi and were unable to keep Ubertino from exerting considerable influence in high ecclesiastical circles.

Ubertino also became the confidant and servant of a prominent cardinal, Napoleone Orsini, who looked kindly on the Spiritual faction of the Franciscans. Ubertino was appointed Orsini's chaplain in 1306 (though their connection seems to have begun earlier) and as late as 1324 was still doing important diplomatic work for him, helping conduct negotiations between Pisa and Aragon. In 1307, Ubertino was in Tuscany trying to further efforts on behalf of the Florentine exiles and was also undertaking juridical activity against the heretics of the Free Spirit. At about this time, he was also becoming increasingly involved in defending the interests of the Spiritual Franciscans; he served as procurator for various Spiritual groups, carrying their cases as far as Avignon.

Orsini's protection, and perhaps that of Cardinal James Colonna as well, must have been vital to Ubertino during the many years when he was able to frustrate the designs of the Franciscan leaders against him. He also seems to have elicited some sympathy from the popes to whom these leaders complained about him—Clement V and John XXII. At the time of the Council of Vienne (1310-1312), Ubertino wrote polemical treatises defending Olivi, advocating the doctrine of "poor use" for the

Franciscan order, and pleading that at the very least the Spirituals should be allowed to follow the will of Francis and be free from persecution by the order. These writings were reflected to some extent in the bulls of Clement V, although in the end Clement refused to grant the Spirituals exemption from their superiors. The Spirituals fared worse under John XXII, but after their downfall Ubertino was not turned over to the authorities of the order. Instead, he secured from John a bull (20 October 1317) permitting him to enter the Benedictine house of Gembloux in the diocese of Liege, though there is no record that he ever set foot there. Ubertino was still in Avignon in 1322, when John asked him and a number of cardinals, bishops, Franciscans, Dominicans, and other clerics for their opinion on whether, as the Franciscans asserted, Christ and his apostles had owned nothing either individually or in common. The pope eventually issued a bull condemning the Franciscans' claim that only their order, which professed corporate as well as individual poverty, fully imitated the life of Christ and his apostles; in this bull, John came very close to quoting some of Ubertino's earlier arguments against the practices of the Franciscan community.

But Ubertino's longtime defense of Olivi finally made it possible for the Franciscan community to bring him down. In 1325, in a bull directed to the Franciscans, John described Ubertino as a fugitive—Ubertino having fled from Avignon in fear of imminent condemnation—and ordered his arrest. Ubertino may have escaped to the court of Lewis of Bavaria, and he may have helped in the writing of some of Lewis's attacks on John XXII; this hypothesis rests mainly on Albertino Mussato's testimony that Ubertino and Marsilius of Padua accompanied Ludwig to Rome in 1328. There is contemporary testimony that Ubertino preached on behalf of Ludwig's Franciscan antipope Peter Corbara.

The date and manner of Ubertino's death are unknown, though a later tradition of the Fraticelli (a Spiritual Franciscan group) held that it was violent.

Ubertino was an interesting combination of ascetic, polemicist, and diplomat. He was a gifted rhetorician and, particularly in his polemical works, a brilliant satirist. He poured into the *Arbor vite* his often moving meditations on Christ's life and the similarities between Christ

and Saint Francis. This work, obviously constructed in large part from Ubertino's earlier sermons and treatises, also contains a multitude of long and short extracts from various authorities: the church fathers; Bernard, Bonaventure, Olivi, and other Franciscan writers; and Thomas Aquinas. There are surely also many sources that have not yet been identified. The fifth book of the *Arbor vite*, containing Ubertino's views on ecclesiastical history, is mainly based, as Manselli (1965, 1977) has shown, on Olivi's *Postilla in Apocalypsim*. Ubertino's polemical treatises are vivid, supple, and remarkably readable, despite the technicality of their arguments. In these works, the historical dimension disappears, and "poor use" is emphasized much more than corporate expropriation. In 1322, the pope commanded Ubertino to enlarge his oral opinion on whether Christ and the apostles had possessed nothing, either individually or in common. Ubertino did so in the unpublished treatise *De altissima paupertate* (*Treatise on the Highest Poverty*), largely copied—although with significant omissions, additions, and modifications—from Olivi's question 8, *De altissima paupertate*, in the series of questions called *De perfectione evangelica*. Ubertino's summary of that treatise, *Reducendo igitur ad brevitatem*, was included in a famous collection of opinions on the question, in manuscript Vatican Latinus 3740, and attracted a marginal note in the pope's own hand. This summary drew a number of its arguments from Olivi's question 9, dealing with whether *usus pauper* was included in the Franciscan vow of evangelical poverty. Cardinal Orsini's opinion contained in the same collection follows a line of argument similar to Ubertino's and may actually have been written by Ubertino.

Ubertino's doctrines regarding poverty are the most interesting aspect of his thought. They seem to have undergone considerable development over his lifetime. In the *Arbor vite*, Ubertino accepted the official Franciscan view, shared by all factions, that as followers of evangelical perfection, if not as prelates transferring goods to the poor, they absolutely embraced corporate as well as individual poverty. To this he added Olivi's view that "poor use" was necessary to the observance of the highest poverty, and that the persecution of those who followed "poor use" was a sign of the appearance of the Antichrist and the coming of the "last age."

In Ubertino's polemical treatises, this historical dimension of his

thought disappears entirely, and he is much more concerned with poor use than with corporate expropriation. In his final treatise, written when he was nominally a Benedictine, Ubertino was unwilling to accept the traditional view that the holding of collective property by monastic corporations according to human law was no breach of evangelical perfection. He did, however, clearly affirm, against the Franciscans, that possession according to natural (though not civil) law was inseparable from the use of consumable things. The Franciscans' theory, on the other hand, maintained that Franciscans had only the use of such things, whose ownership always rested with the donors or was held by the pope. Ubertino now evidently regarded this theory as a pitiful pretense. He also thought that it was ultimately inimical to Olivi's doctrine of "poor use," a doctrine to which—despite his careful editing and revision of Olivi's question concerning the highest poverty—he always remained faithful.

Ugolino Di Vieri

Ugolino di Vieri (died c. 1380 or 1385) was a well-known goldsmith of Siena about whom we have documentary evidence for the period from 1329 until his death. His major work is a gold and silver reliquary (1337-1338) crafted for the Holy Corporal, preserved in the cathedral in Orvieto. This reliquary, in the Gothic style, has eight small statues of apostles and prophets, a crucifix with Mary and John, and some thirty enamels that depict the life of Christ and the miracle of the Holy Corporal (the miracle of Bolsena"). The influence of Ambrogio Lorenzetti and Duccio (the *Maestà*) on these scenes—and that of Giovanni Pisano on the sculptures—is evident. Another known work by Ugolino is a reliquary for the head of Saint Savino (*duomo*, Orvieto), which he made in collaboration with the obscure Siennese artisan Viva di Lando.

Uguccione Da Lodi

The poet Uguccione da Lodi (thirteenth century) was from northern Italy, but despite the apparent toponymic designation in his name, he was probably a member of a well-known family in Cremona. If so, he would be a contemporary of Gerardo Pateg. Virtually nothing is known about Uguccione's life, and the debates concerning his place of origin carry over into the attribution of works to him. However, one work is his beyond all reasonable doubt—the so-called *Libro*.

The *Libro*, which displays the metrical influence of Old French and Franco-Veneto *chansons de geste* and thematic traces of Old French didactic works, consists of 702 verses divided into stanzas of monorhymed alexandrines (fourteen-syllable lines) with groups of hendecasyllables at both the beginning and the end. Modeled on the techniques of sermon literature, the *Libro* constantly reminds the reader of earthly corruption and how worldly temptations lead to sin and, eventually, to perdition in hell. As part of its didactic intent, the poem furnishes many examples taken from the Bible and from everyday life and urges the reader to serve God and to follow his commandments in order to win the eternal rewards of paradise. As a devotional work, the *Libro* is rich in both sententious phraseology—e.g., *Avaricia en 'sto segoio abunda e desmesura* ("In this world avarice abounds and knows no limits")—and seemingly ecstatic utterances, such as the following:

Iusta devinitad, verasia maiestate,

*omnipotente Deu sovr' ogra poestate,
misericordia Te clamo con grande pietate
qe me secori per la Too bontate. . .*

("Righteous divinity, true majesty, omnipotent God over all other powers. With great piety I entreat you for mercy that through your goodness you may help me. . . .") One point of interest of the poem is its language, which is similar to that used by other northern Italian didactic poets of the period: Bonvesin de la Riva, Gerardo Pateg, and Giacomino da Verona. In the manuscript (Saibante-Hamilton 390, Staatsbibliothek, Berlin), the text of the *Libro* is followed by another poem, referred to as the *Istoria*, which presents virtually the same subject matter in 1,142 *novenari* (with some *ottonari* interspersed) arranged in rhymed couplets. There is no reason to assume, as some critics have done, that these two poems are actually one; indeed, it is likely that the second is simply a later continuation by an anonymous author.

Uguccione Da Pisa

Under the entry *Pis* in *Derivationes*, Uguccione (c. 1125 or 1130-30 April 1210) states that he was born in Pisa—without, however, indicating the year, which has had to be estimated by his biographers. The date of his election as bishop of Ferrara is likewise uncertain. He completed his studies at Bologna, where in all probability he wrote his grammatical treatises. Later, he began to lecture on Gratian's *Decretum*, perhaps at the monastery of Saint Nabore and Saint Felice, where Gratian had taught. One of Uguccione's students was Lothar, a count of the Segni, who later became Pope Innocent III. Uguccione headed the diocese of Ferrara until his death. During his years as bishop he was given important assignments by popes Celestine III and Innocent III, his former pupil, mostly for the purpose of resolving a crisis at Nonantola, which was governed by an *abate* insufficient to the task. The archbishop of Ravenna, Guglielmo Cu riano, also entrusted Uguccione with settling disputes between the inhabitants of Ravenna and those of nearby Rimini. The outline of these biographical events agrees with the traditional view according to which Uguccione da Pisa, bishop of Ferrara, was, as both lecturer on grammar and canonist, the author of all of the works mentioned below. Miiller (1991, 1994) has challenged this view, arguing that the grammarian and the canonist should not be identified as the same person.

It will be useful to point out links among Uguccione's works, based on internal cross-references. The *De dubio accentu* and *Rosarium* are

cited in *Derivationes* and explicitly referred to by name in the *Agiographia*, which is itself referred to by name in the *Summa decretorum*. These references constitute the writer's claim to authorship and the basis for all further critical discussion of his works.

De dubio accentw. This brief treatise provides the correct pronunciation of a number of compound words or words in which the penultimate syllable is followed by a mute plus a liquid. In a set of appendixes, Ugucione deals with more specialized issues relating, again, to pronunciation, and also to spelling. Giovanni Balbi's *Catholicon* often draws on this text, while occasionally deferring to Bene da Firenze's teachings.

Rosarium: This treatise on grammar, cited twice in the *Derivationes*, is preserved in a single manuscript dating from 1382, Erfurt Ampl. Q. 69 (252), ff. 1-63. It provides a summary of *ars grammatics* based on the eight parts of speech. A list of conjugated verb forms, arranged alphabetically (*amo, amas, etc.* to *zelo, zelas*), appears on leaves 24ra—54rb.

Derivationes: Preserved in more than 200 extant manuscripts, this lexicon comprises the entire patrimony of the Latin language, classified by the principles of word derivation. It constitutes a fundamental stage in the development of medieval Latin lexicography because it organizes a large amount of linguistic data into derivational groupings and because it integrates into this scheme erudition passed down from antiquity, to be preserved and passed on to future generations. The work remains unpublished.

Agiographia: This short text also uses the word derivation format, which, in its most noteworthy section, presents a list of saints' names, arranged according to the liturgical calendar; these are then glossed with reference to traditional hagiographical aspects relating to holy deeds leading to canonization. The work serves as a bridge between Ugucione's two major texts; it is cited in the *Summa decretomm*, and it makes, in turn, an explicit reference to the *Derivationes*.

Summa decretorum: Ugucione worked on this text from 1178 to at least 1188. However, some questions arise as to whether the commentary regarding cases 23-26 is authentic or the work of one of Ugucione's continuators. Relatively recently, this text has been subjected to renewed scrutiny by historians of canon law, in an attempt

to understand Uguccone's views on the thorny issue of the relationship between the two supreme authorities on earth—the papacy and the empire. According to some, Uguccone's thinking on this subject may have inspired Dante's *Monarchichia*; indeed, Dante explicitly cites the *Derivationes* in his *Convivio* (4.6.5). The *Summa decretorum* also deals with a number of questions pertaining to the theology of the sacraments. For the manuscript tradition of this *Summa*, still unpublished, readers should consult Leonardi (1956-1957).

Expositio de symboio apostolorum: This text is attributed to Uguccone in Trombelli (1775) and codex 2633 in the University Library of Bologna but is not cited by him in any of his other works. It offers a commentary on the twelve articles of the *credo*, thereby constituting itself a catechism on the fundamental beliefs of the Christian faith. This brief exposition may be the fruit of Uguccone's pastoral activity, undertaken during the last twenty years of his life as bishop of Ferrara.

Uguccione Della Faggiuola

Uguccione della Faggiuola (1250-1318) was born into a Ghibelline family. He became renowned as a military and political leader throughout northern Italy. At various times he was *podestà* of Arezzo, Gubbio, and Pisa; *capitano del popolo* (captain-general) of various cities, including Cesena and Pisa; and ruler of Lucca.

Having brought peace to Arezzo in 1303, Uguccione was appointed its *podestà* after gaining the support of Pope Boniface VIII. But because the success of his campaign had derived in part from an alliance with

Guelf forces, his reign was short-lived: the Ghibellines expelled him from the city the following year. He returned to Arezzo in 1308, after having married one of his daughters to the leader of the Black Guelfs in Florence, Corso Donati, and once again became its *podestà*. from 1309 to 1310. Shortly thereafter he joined forces with Henry VII of Luxembourg when Henry descended into Italy, and he served as Henry's vicar in Genoa. After Henry's death, Pisa named Uguccione *podestà* and captain-general for a ten-year term. During this period he consolidated his power through several acts of ruthless violence, and he gained the support of Castruccio Castracane in his mission to force Lucca to return appropriated territory to Pisa. Uguccione achieved his greatest military victory in 1315 at the battle of Montecatini, where he destroyed the Guelf forces. Over time, his position of strength was weakened by his tyrannical mode of governing and his generally dissolute behavior, coupled with a political policy that adversely affected Florence. In 1317, he took refuge in Verona, placing himself in the service of Cangrande della Scala, who appointed him *podestà* of Vicenza. Uguccione died in battle at Vicenza a year later.

Uguccione was cited as one of Dante's ideal political figures by Boccaccio, on the basis of a supposed letter to Frate Ilaro, which claims that Dante dedicated the *Inferno* to Uguccione in gratitude; supposedly, early during his exile, Dante had been a guest at one of Uguccione's castles. Neither the letter nor the legend to which it gave rise has been accepted by critics as authentic, although one has advanced the theory that the *veltro* ("greyhound") of *Inferno* 1 (101), the prophesied destroyer of the *lupa* ("she-wolf"), is to be identified with Uguccione. Historical records (chiefly Villani's chronicle) show, however, that Uguccione was not only tyrannical, brutal, and power-hungry but also avaricious, and therefore an unlikely candidate for the solution to the problem of greed represented by the she-wolf.

Universities

Just as Paris was the ancestor and model of the northern European universities, Bologna was the point of origin for the autonomous development of Italian universities. Bologna's specialty from the very beginning was Roman and canon law, usually called the "two laws," There were also some independently founded schools of higher education: the ancient schools of medicine at Salerno, a lively native university at Arezzo, a royal university at Naples, and two papal *studia*. But with these exceptions, all the other Italian universities began as secessions from Bologna and shared its corporate structure and curriculum. Much of the instability of the later foundations may also be attributed to this origin, for they necessarily inherited the tension between student populace and commune that typified life in Bologna and repeatedly caused the scholars to flee. After an initial fifty turbulent years of institutional life in the first half of the thirteenth century, Bologna never, in fact, had a serious rival for first place among Italian schools. The fame of Bologna began with its great teachers—especially Irnerius (d. c. 1130), a specialist in Roman law; and the monk Gratian (died c. 1159), the founder of studies of canon law. These men organized the teaching of law by recovering authoritative texts and by creating systematic methods for glosses and commentaries. In the early years,

Roman law was studied largely by laymen and Italians. The study of canon law, by contrast, was immediately of interest to clerics, who came from all over Europe to study at Bologna and returned to found faculties of canon law throughout the continent.

Bologna's institutional hallmark was the student university, a corporate organization of the students as a governing body for their own affairs. (The word *universitas* originally meant a corporation or guild and could be any voluntary organization; what we call a university was properly called a *studium generate*, meaning a school of broad studies whose teaching certificates were universally recognized, according to what was called the *ius ubique docendi*, the right to teach everywhere.) At Bologna, the curriculum was regulated, the faculty was certified, and fees were set by the law students' guilds in the person of the rector and other representatives of the student "nations" (at first four and finally two, the Italian and Ultramontane). The nations and the various smaller national groups within them, sometime also called nations, were the focus of student life and culture. By the time of the first surviving statutes (1317), there was a clear rotation of the rectorship of the Ultramontane university among student leaders of rival nationalities. Thus, in one year of every three the rector would be a German; in other years he was chosen from among the French, English, Spanish, or other non-Italian students. The power of the student universities derived from their economic importance to the city; some estimates suggest that as many as 10,000 students resided in the city c. 1250, when its total population was only 40,000. Most of the students were foreigners—i.e., not Bolognese—whereas most professors had or acquired Bolognese citizenship. This provided the teachers with the protection of the commune and ensured that they would often side with it in disputes. The students, meanwhile, were left with scant protection under local law and had to devise their own regulatory mechanisms in the face of the citizens' hostility. Students from the city who could claim citizenship were excluded from the student universities whose legal protection they did not need. Early in the thirteenth century, the commune of Bologna opposed every new pretension of the student universities, a policy that led to a series of secessions. The most important was that of 1217-1220, when the students virtually deserted Bologna for law schools already existing at

Reggio and Vicenza; professors, dependent on students' fees, went along. A further major secession occurred in 1222, giving rise to Bologna's most enduring rival, Padua. There were similar departures en masse from Bologna in 1246, to Siena; and in 1276, to Perugia. In 1228, the secessionist fever led many of the students who had only recently arrived at Padua to move on to Vercelli. Of these unwanted offspring of Bologna, only Padua had an uninterrupted existence into the fourteenth century. By the mid-1240s, the city of Bologna had conceded most of the eventual privileges of the student corporations, including the full protection of the law, but the scholars continued to exercise their rights of boycott and secession in times of dispute. Notable groups seceded or were lured away to Padua in 1260-1262, 1274, and 1306; to Arezzo, Siena, and Florence in 1321-1328; and to Florence again when that *studium* was refounded in 1349.

Bologna's powerful student corporations were not the first organization of the *studium* there, for the university seems to have started (as at Oxford and Paris) with a professional guild or corporation of professors. Such an organization is presupposed by the "Authentic *Habitus*," a decree of Emperor Frederick I Barbarossa in 1158 that granted imperial protection to scholars at all levels. This grant was intended to free foreign scholars from reprisals by the governments of university towns, but it also established an important notion of academic freedom in that it allowed students to choose whether their legal disputes would be settled in a bishop's court or by their own professors. In contrast to northern European universities, where most students were clerics, the Italian schools of Roman law and the arts faculties were largely composed of laymen both as teachers and as students. This gave the Italian universities a strongly secular character. In the bitter town-and-gown controversies, moreover, the local governments came to play an ever larger role in safeguarding the university and even in financing it. During the disputes of 1217-1220 at Bologna, Pope Honorius III imposed a rule whereby the licenses to teach that accompanied doctoral degrees were to be conferred by the archdeacon of the cathedral. This was analogous to similar attempts by the bishop to impose supervision on the schools of Paris in the same period, but at Bologna it had the effect of excluding the bishop from the affairs of the university by vesting the church's right to supervise in

another local official. The papal rule was probably accepted easily at Bologna because the masters there already cooperated with the student universities in the matter of curriculum and did not see the presence of a church official as infringing any exclusive right of the professoriat. Instead, the new rule was a way of asserting the universality of the Bologna degree. Later in the thirteenth century, the rights of the archdeacon at Bologna and analogous officials in other Italian universities were disputed. But for the most part, direct involvement by such church officials in Italian universities remained minor for most of the Middle Ages.

The curriculum at all the Italian universities was dominated by the study of the two laws. In this they followed the lead of Bologna. The traditional arts courses—grammar, dialectic, and rhetoric—were modified under the pressure of legal studies into a specialized preprofessional sequence in the Latin language. Emphasis was on writing skills needed by government officials, clerks, and notaries, embodied in *ars dictaminis* (letter theory) and *ars notariae* (notarial study). Critical philological, philosophical, and moral study of literature together with speculative philosophy were the content of the arts courses in the rest of Europe, but these subjects were not a major part of the program of Italian universities in the thirteenth century. A transformation of the arts course so that it centered on letter theory occurred c. 1200, starting at Bologna; it was a rejection of university-level study of the classical authors, a practice that continued somewhat longer in northern Europe but eventually gave way there too, in the course of the thirteenth century, to speculative and philosophical study of grammar and logic. In both cases, the advanced study of arts was professionalized, but Italian scholars did this by adapting the course to the needs of law, the dominant discipline in their tradition, while the French arts schools reflected the methods of theology, "queen of sciences" at Paris. Much of the early humanists' rejection of university training stemmed from the realization that the curricular demands of the law course had led to a degradation of classical norms in writing Latin.

Medicine was an important field in Italy and was represented in most university programs, often in a combined faculty of arts and medicine. There were medical schools at Salerno from the tenth century on, but

they were based on clinical practice and had no university structure until after Frederick II attempted to co-opt them for his new university at Naples in the 1220s. By the early fourteenth century, Salerno was in decline. Elsewhere in Italy, the first explicit mentions of university professors of medicine are from the second quarter of the thirteenth century; but Arezzo, Bologna, and Padua probably had professors of medicine much earlier. Bologna in the late thirteenth century and Padua in the fourteenth and fifteenth centuries became almost as well known for medical studies as for law.

Theology was a relative latecomer to Italian universities, largely because of the early preeminence in this field of the schools of Paris. But even though the only theological faculty in Italy in the thirteenth century was that of the Roman curial college, which followed the papal court, theological studies could be pursued at Bologna and in many other university towns at the *studia* of the mendicant orders. When theology was added to Italian university programs, in most cases after 1350 as part of a papal program to develop theological studies in centers outside Paris, this was accomplished by grouping the teachers of existing religious *studia* in those cities into new faculties of theology within the old universities. The relative strength of medicine and weakness of theology meant that philosophical studies in the Italian universities typically developed not as an offshoot of systematic theology (as at Paris or Oxford) but in the context of medical theory. The Italian scholastic tradition, as a result, was more concerned with physics than metaphysics, while Aristotelian logic was taught to all candidates for medical degrees but not necessarily to students of grammar and rhetoric. This is the reason why the arts disciplines and medicine were usually grouped in one faculty in Italy, something that rarely occurred elsewhere in Europe.

The most important of the Italian universities not founded from Bologna was that of Arezzo, which became a major regional university, although it never had an international reputation. In the last decades of the twelfth century, flourishing private and church-sponsored schools of law and grammar, and possibly also of medicine, were already making Arezzo the principal Tuscan center for higher studies. In 1215, these schools were given further impetus by the arrival from Bologna of a famous professor of Roman law, Roffredo of Benevento, who attracted

large numbers of students and set off a period of rapid growth. By the time of the first known statutes of 1255 (the earliest Italian university statutes to survive), the university had eight chairs salaried by the commune: four in law, two in grammar and dialectic, and two in medicine. These professors constituted a *collegium* that governed the behavior of the faculty and students, set fees and course schedules, examined for degrees, and certified licenses to teach in all the schools of the city. Arezzo's licenses were recognized throughout Tuscany. No student statutes survive, but students probably had their own *universitas* and were certainly represented by an elected beadle who was also a notary. We must envision, therefore, a faculty-directed university with municipal financing, very different in kind from the Bolognese model.

The 1250s were the golden age of Arezzo's university, even as the city's power in Tuscany waned. The university was forced to close its doors in 1260-1261, in the political chaos that followed the battle of Montaperti. But it was prestigious enough to weather this storm; it reopened in November 1261 and survived and flourished for nearly thirty years more even in the face of Arezzo's continued political and economic decline. In 1285, Arezzo's schools served as a model for the reform of Siena's university. However, the final military disaster suffered by Arezzo at Campaldino in 1289 signaled the decline of its university as well. By 1312, all the professors had left. Attempts to revive the *studium* were made in 1338 and 1355, but not until 1450 could Arezzo again boast of an enduring university.

As Arezzo declined, Siena became the principal university in Tuscany. During the disputes at Bologna in the 1320s, the governing council of Siena set out to lure away as many students and faculty members as possible with promises of secure salaries and housing subsidies. Although many of the scholars returned to Bologna later, this government-sponsored program ensured that Siena would thereafter have an international reputation. Finally, in 1357, the city fathers obtained an imperial privilege that named Siena a *studium generale* and granted its graduates the *ius ubique docendi*.

Naples too had a university independent of the Bolognese model, founded in 1224 by a decree of Frederick II. It was intended to give southern Italy a native institution of higher learning to rival Bologna,

and to provide lawyers and civil servarus for the royal government. On this account, its foundation decree stipulated that subjects of the emperor were henceforth forbidden to study elsewhere, a provision clearly aimed at Guelf Bologna. Supervision of the *studium* was placed in the hands of a royal official. Its corporations were organized by discipline and included both masters and students, apparently on the model of similar guilds at Montpellier; Salerno also provided models For some of the institutions at Naples. Frederick probably intended to transfer Salerno's ancient medical schools to Naples but never succeeded. Indeed, the emperor's attention to the whole effort seems to have wandered more than once, and the university did not really establish itself in his lifetime. The *studium* was effectively refounded in 1266 by Charles of Anjou and played an important role in the cultural life of Naples into the fifteenth century.

The *studium curiae* or Roman curial university was also a princely foundation, created by Pope Innocent IV in 1244-1245 with faculties of theology, canon law, and civil law. It had no fixed seat but followed the papal court and served primarily as a source of benefices for clergy in the papal and cardinalate households. It was governed by a faculty *collegium* under the chairmanship of the cardinal chamberlain. A second papal university, the *studium urbis* in Rome itself, was founded in 1303 by a decree of Pope Boniface VIII. It suffered from Boniface's early death but survived the subsequent Avignonese papacy. As reformed in 1431 by merger with the *studium curiae*, it is the ancestor of the present-day University of Rome. During the fourteenth century, it had universities of students and masters on the Bolognese model. Close control by papal officials was foreseen by the founding decree, but with the absence of the papal court, lay officials of the city of Rome assumed real control of the university administration.

Padua was one of the earliest offshoots of Bologna and its only serious rival at any time. Although Padua's greatest flowering was in the Renaissance when, especially for sciences and medicine, it outranked even Bologna, the university was large and distinguished from the beginning. It benefited from being relatively close to Bologna (and thus being an easy place for discontented scholars to go) and from continuous, strong support by the city's rulers: at first the bishop and commune, then the Carrara and Delia Scala lords of Padua, and finally

the republic of Venice. Venice had no university before modern times and adopted Padua in the fifteenth century as the chief institution of higher learning for the expanding Venetian territorial state. Similarly, several attempts to create a university at Florence in the fourteenth and fifteenth centuries ended with the transfer of the Florentine *studium* to Pisa in 1472.

None of the largest Italian cities of the Middle Ages had major universities, with the exception of the unique royal foundation at Naples. The reason for this situation is probably to be sought in the commercial ideals and aspirations of the rulers of the great cities. The Genoese, Milanese, Venetians, and Florentines seemed ready to send their younger sons—those destined for professional and church careers—away to school; and they seem at the same time to have been unwilling to entertain the presence in their own cities of large populations of foreign students. Italy's flourishing medieval universities, therefore, remained the property of cities of the second rank.

There is no single bibliography for the history of the Italian universities as such. Reviews of the literature on individual universities appear in local historical journals and in the publications of the Italian universities themselves. The most useful of these is *Quaderni per la storia dell'Università di Padova*. At the time of this writing, the massive *Bibliographie internationale de l'histoire des universités* had not yet published a volume for Italy, but many aspects of university history in general were addressed in the volumes already issued. Also useful for studying universities in general are book reviews and articles in *History of Universities*.

Urban Development

Like most structures of the late Roman empire, cities contracted and urban life disintegrated as the empire fell. This urban decay was most pronounced in the western half of the empire. Beginning in the tenth and eleventh centuries, cities expanded, and urban life recovered in western Europe as a consequence of the "commercial revolution." This urban revival was most pronounced in Italy, especially northern Italy, since this was the birthplace of the commercial revolution. By the end of the Middle Ages, a number of Italian cities had even transformed themselves into city-states, which governed territorial empires, controlled world markets, fashioned European diplomacy, and fostered the artistic and intellectual movements of the day. The unique culture of the Italian Renaissance was based on, and was a result of, medieval Italian city life. Yet the splendor, power, and vibrancy of a city like Florence during the *Quattrocento* would have been hard to discern in the cities of Roman Italy in the fifth century.

The Roman empire rested on a foundation composed of cities. Because of the economic problems and political confusion of the late empire, the state began to depend excessively on that foundation. The state taxed cities and their inhabitants heavily and regulated the activity of artisans and commercial groups. Urban officials served as imperial administrators and were personally liable for the taxes owed from their district. Occupations became both hereditary and onerous for the urban classes, whose only relief was to desert the positions and the cities. The flight from the cities was hastened by political conflict during the late imperial period and by the invasions of German tribes. By the end of the third century and the beginning of the fourth century, most Italian cities had erected walls for defense. Significantly, the urban area that these walls encompassed was smaller than before. The physical shrinking of the city reflected the shrinking of its population. Urban building ceased, cities abandoned their forums, and public

buildings were mined to help build the walls. As imperial political and economic control became decentralized, cities, like dying stars, collapsed in on themselves. The devastating Ostrogothic-Byzantine war (535-554) hastened this collapse, and the advent of the Lombards (c. 568) almost eliminated the once-elaborate Roman civic administration in Italy. Cities, which were once economic and residential centers, became primarily military and ecclesiastical administrative centers. The bishop became a central figure in city administration, as did the representative of the local military or tribal leader.

Although one-fourth of the Roman cities in Italy completely vanished, the truncated survivors preserved at a minimal level the hallmarks of Roman urbanism: civic administration, public buildings, and the classical heritage. Notaries, for instance, preserved elements of Roman law. In addition, many Italian cities in the early Middle Ages lived in the shadow of Byzantium and preserved a modicum of urbanism fueled by trade with the Byzantine empire.

Although the market systems of Italian cities were too underdeveloped for an urban revival under the Carolingians, city bureaucracies did grow and cities developed their own legal codes. Cities increased their autonomy as the authority of the Carolingians and their successors waned. Raids by the Muslims and Hungarians forced cities to serve as places of refuge and to develop their own military force, a militia organized by city quarters. Cities began to receive various liberties from the kings. Some bishops even received political power and were particularly conscientious about organizing defensive walls. The autonomy of the cities was exemplified by the development of bitter rivalries between them, a feature of Italian urban development throughout the Middle Ages and Renaissance.

Around 1100, throughout Italy, there was a political revolution in the towns. Where once government authority had lain in the hands of the bishop or local representative of the emperor, a sworn assembly of the citizens elected an executive body (usually four to twelve men) to rule over them. These were the consuls, a name that reflected the classical heritage of these cities; and this was the birth of the commune. A later addition was a body of advisers to the consuls; this advisory body was called the council or senate. This communal development stemmed from the idea of corporate unity, an idea so dominant in Italian urban

development that families, guilds, and political factions had a corporate organization parallel to communal organization.

Communes began to expand their authority and populace beyond their walls, and even extended their walls during the High Middle Ages. The commercial revolution generated this renewal. By 900, Milan was the commercial center for its surrounding region, and rural families, including major landholding families, flocked to it. The Italian urban revival and the commercial revolution itself were fostered by these landholding families, who supplemented their position by participating in trade. By 1000, Milan was the hub of the trade network of northern Italy. Communes were involved in both long-distance and local trade. The rise of Venice as an economic power and an urban entity was fueled by its monopoly of the local salt trade and its control of trade in the Adriatic. This growth accelerated through Venice's long-distance trading contacts with the Byzantine empire. Other port cities benefited from their contacts with the wider Mediterranean world. Pisa and Genoa especially benefited from trading contacts made during the crusades. This trade generated further economic and industrial growth, such as shipbuilding. Complicated trade networks developed. Venice was the center for trade uniting central Europe, the Po valley, and the Levant; Milan was the center for trade uniting northern Europe and Italy; Genoa was the center for trade uniting northern Europe and the western Mediterranean. Smaller towns duplicated the economic activity of the larger ones. Moreover, Italian merchants operated internationally. Some areas internationalized their local economy: San Gimignano marketed its saffron throughout the known world. Economic activity and wealth were distinctive features of Italian urbanism.

As control of trade became crucial for urban development, Italian cities squabbled over trade routes. Pisa and Genoa fought for control of the western Mediterranean, and Genoa and Venice fought for control of the eastern Mediterranean and the Black Sea. Inland cities also squabbled over trade routes. Florence and Lucca fought for control of routes linking the northern and central areas of Italy. By the early fifteenth century, five cities—Milan, Venice, Florence, Rome, and Naples—dominated Italian economics and politics.

As the urban elite became wealthier and more numerous, its members wanted more of a say in their government: in maintaining

peace, defending their city, promoting their interests, and exercising judicial and fiscal authority. Communes directed their grievances against the local lay or ecclesiastical lord, who usually represented the Holy Roman emperor. Tension between the papacy and the empire during the investiture controversy (1075-1122) and afterward also influenced urban political development, with cities forming rival parties to support either the papacy (Guelfs) or the empire (Ghibellines), though these parties were always defined by local issues. This factionalism was also a distinctive feature of Italian urbanism in the Middle Ages.

Although the transition from lordship to commune could be violent, many times it was not, and the bishop or lay lord accepted the authority of the commune or even became its active ally. Communes eventually usurped the state's rights of coinage, tolls, customs, justice, and war. Communes also instituted political control of the countryside around the city. Efficient control of the countryside guaranteed food, troops, and taxes for the city and eliminated the power of the rural nobility.

Despite their rivalries, communes defended their rights against the Holy Roman emperor. In 1167, the communes of northern Italy formed a league to oppose attempts by Frederick I Barbarossa to reimpose imperial authority. The treaty of Constance (1183) formally recognized the communes and their rights. The communes also united against Frederick II (1195-1250) and his attempts to reimpose imperial authority in Italy.

Communes also experienced considerable internal strife. The minor landholding nobility, who had recently moved to the city and begun to engage in trade, collided with the major landholding families, who had also been living in the city and engaging in trade. Both groups clashed with the artisans and the strictly urban merchants. Internal disputes based on family, wealth, status, occupation, and residence (quarters and districts developed rivalries) exemplified the complexity and vibrancy of Italian city life. The constant stream of immigration from countryside to city, a result of population growth and the city's control of the countryside, exacerbated these tensions. Families built defensive towers that studded the urban landscape; vendettas proliferated. These internal disputes became a standard feature of Italian urban

development throughout the Middle Ages and Renaissance.

Because of these disputes, Italian cities witnessed a political evolution from the mid-twelfth century to the mid-thirteenth century. This was the advent of the *podestà*, an outside executive, who was usually specially trained for this position. He came equipped with his own advisory council; his own bureaucracy, including judges, treasurers, and notaries; and his own soldiers to enforce order. His goal was to ensure order and justice; however, podestas tended to fail, largely because factional tendencies were too intense. One unpopular *podestà* had his teeth removed by his opponents; he prudently quit. Despite its failings, government by podestas dramatically increased the number of urban officials and refined the cities' revenue-gathering tools, instituting both direct and indirect taxes. Cities also funded debt. The rising cost of warfare to maintain the city against its rivals and to ensure its control of the countryside necessitated this; in the late thirteenth century, cities shifted from using an urban militia to relying on mercenary bands.

From the early thirteenth century on, a state within a state developed in most Italian cities. This was the *popolo*, a guild-based pressure group that reflected the tension between the urban nobility, who held political authority, and the lesser merchants, artisans, and bureaucrats, especially the recent arrivals, who wanted political power. Some nobles gave up their status and joined with the *popolo*. The *popolo* had a disciplined and highly structured organization that often paralleled the commune's own governmental structure. Its captain counterbalanced the *podestà*; its council of representatives from guilds, professional associations, militia companies, and districts and neighborhoods counterbalanced the commune's council. The *popolo* had its own officials, such as the executor of justice, whose role was to protect members from the commune's officials, especially the *podestà*. Unfair taxation and unequal justice, both of which favored the urban nobility, caused the *popolo* to demand communal offices. In some communes street brawls turned into civil war, and the *popolo*, because of its use of violence and its ability to join with one of the noble factions, forced out the *podestà*'s government, though it kept the bureaucracy. The new regimes instantly put social and political restraints on the urban nobility, which crippled them politically. These restraints were also

intended to curb violence by the nobles. Regimes based on the *popolo* never extended political power and representation through all the urban classes, but these regimes did have some signal accomplishments, reflected especially in renewed urban building and patronage of the arts. Nevertheless, the *popolo* was dominated by the wealthy, and civic republicanism in Italian cities always implied oligarchy. The failed uprising of impoverished Florentine industrial workers, called the *ciompi* (1378), reflected the reality of oligarchy, the continued existence of factionalism, and the use of violence to solve political questions.

Italian cities saw phenomenal growth in population up to the advent of the black death (1348). Florence, Venice, Milan, and Genoa had populations in excess of 100,000. Then populations fell; Florence, for example, lost one-third of its population, and other cities suffered similarly. Recurrent visitations of the plague and other diseases limited the urban population from the late Middle Ages through the early modern period.

Plague, which killed the poor in droves, and the *ciompi* uprising illustrated a social reality of Italian urbanism. The fabulous wealth of the urban elite existed side by side with the crushing poverty of the urban laboring classes. In some cities one-fourth or more of the population had neither property nor any other possessions and lived a precarious hand-to-mouth existence. City governments experimented with poor relief and control; and private organizations, such as religious confraternities and the Franciscans, tried to alleviate the effects of poverty.

Oligarchy, factionalism, and violence doomed the popular regimes and paved the way for the accession of *signori*—regimes dominated by one man. One faction would eventually gain power in a commune and would then extend the term of the urban executive, either the *podestà* or the captain, for life. Its opponents would then be exiled. Like a wave, signorial governments spread throughout Italy in the fourteenth century, although Florence—until the advent of the Medici (1434)—resisted this form of government, as did Venice.

Signorial rule was personal and could become dynastic, reflecting a change in the urban ethos. To secure public order, government became a private possession. Despite this curtailment of personal liberties and loss of public responsibility, signorial cities were more peaceful than

their predecessors. Moreover, the *signore* and his court became the font from which the cultural achievements of the Italian Renaissance poured forth.

Urban II, Pope

Pope Urban II (Qdo of Lagery, Eudes de Chatillon; c. 1035-1099, r. 1088-1099) was a church reformer and founder of the crusading movement. Urban was a native of France and was descended from a noble family of Châtillon-sur-Marne, near Soissons; Odo was his baptismal name. During his early school days at Reims, he came under the influence of Saint Bruno, the founder of the Carthusian order, who remained a potent influence in shaping his goals and values even after he had become pope. Odo's early career followed a pattern common among young clerics of noble lineage. After becoming archdeacon of Reims by 1160, he abandoned his career among the secular clergy and entered the monastery of Cluny. There, too, he advanced rapidly. By c. 1070 he was prior of Cluny; then Pope Gregory VII recruited him into the papal service in 1079-1080 and soon named him cardinal-bishop of Ostia,

Odo served Gregory diligently, at times at considerable peril to himself, notably when he was a-papal legate in Germany during some of the darkest days of the pope's struggle against King Henry IV. When Gregory died at Salerno on 25 May 1085, Odo seemed a likely successor, but the choice fell instead on Abbot Desiderius of Monte Cassino, who reigned briefly as Pope Victor III. Shortly before his death (in 1087), Victor recommended that Odo be elected to succeed him. On 12 March 1088, the cardinals who had assembled at Terracina complied with Victor's suggestion, and Odo was crowned as Pope Urban II the same day.

The papacy was at this point in dire straits. Since Rome and the

patrimony of Saint Peter were in the hands of Henry IV's supporters, papal revenues were greatly reduced, an antipope (Clement III) had the backing of the emperor, and the church reform movement seemed to be faltering. The great achievement of Urban's pontificate was to redress and, in large measure, to reverse this situation.

Urban was in many ways far more successful in implementing the papal reform program than Gregory VII had ever been. He achieved this in part by an unremitting round of meetings with bishops, the clergy, and powerful laymen, in which he preached, argued, bargained, and cajoled to induce his hearers to accept the main planks of the reformers' platform—to refrain from simoniacal appointments to church offices, to restore church property to clerical control, and to commit the clergy at every level to celibacy. At the same time, Urban sought, with considerable success, to reduce the political tension resulting from the confrontations that had marked the pontificate of Gregory VII. In place of confrontation, Urban offered negotiation; instead of demands, he advanced proposals; and he preferred to outmaneuver his opponents rather than challenge them directly.

Urban saw clearly that his reform program could succeed in the long run only if it was securely anchored in the church's legal structure. Accordingly, he devoted a great deal of time and effort to persuading church councils to adopt the principal tenets of his program as church law. He also lavished time and attention on his role as supreme judge in the ecclesiastical court system, and his decisions became an integral part of the canonical jurisprudence of later generations.

Pope Urban II. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 193v.

Urban is best-known, however, as the pope who proclaimed the First Crusade. At the council of Clermont on 27 November 1095, Urban called on the knights, nobles, and bishops of Christendom to join in an expedition to push back Turkish armies that had occupied Asia Minor and to help the Byzantine emperor restore Christian control over the Levant. He further promised that participants in this expedition would receive spiritual rewards, as well as a share in the conquests that they achieved. The council adopted his proposals, which quickly aroused a broad and enthusiastic response—probably broader and more enthusiastic, indeed, than Urban had anticipated. The pope devoted a great deal of time and effort over the following months to spelling out the implications of his proposal and refining arrangements for its organization and implementation.

By the fall of 1096, crusaders from France, Germany, and England were on the way to their rendezvous at Constantinople. In Italy, Urban's proposal aroused interest at first mainly among the restless Norman conquerors of the south, who saw it as an opportunity to secure a foothold in Byzantine territories; and the merchants of a few maritime cities in the north, especially Genoa and Pisa, who perceived that the venture, if successful, might open up profitable commercial opportunities in the Middle East.

After the initial bands of crusaders had departed, Urban once more directed his attention to the implementation of church reform and endeavored to resolve the issues that had put the papacy at odds with the principal monarchs north of the Alps. Although he achieved some successes, his program was still incomplete when he fell ill in the summer of 1099. At the beginning of July, the crusading armies that he had dispatched to the east had taken the city of Jerusalem. News of this momentous victory had not yet reached Rome when Urban died on 19 July 1099."

Urban IV, Pope

Before becoming pope, Urban IV (Jacques Pantaléon; c. 1200-1264, r. 1261 — 1264) had been bishop of Verdun and legate to the Holy Land (1252), and the Latin patriarch of Jerusalem (1255).

Urban's predecessor, Pope Alexander IV, had wanted to replace Manfred (the natural son of Emperor Frederick II Hohen staufen) as king of Sicily with a younger son of Henry III of England; Urban set this scheme aside and substituted Charles of Anjou as the candidate. Charles was to have the kingdom of Sicily, except for Benevento, in return for an annual payment of 10,000 gold *uncie* (later reduced to 8,000), plus a down payment of 50,000 marcs when he received his kingdom; and 300 knights to serve three months in any year, on request, in the papal armies. Charles also promised never to accept the

imperial crown or the kingship of the Romans (it was their holdings in both Germany and Sicily that had made the Hohenstaufen unacceptable to the pope), not to become involved in Lombardy or Tuscany, and to exercise no charge in any town in the papal state. In return, the pope announced a crusade in Charles's support and, to finance it, levied an ecclesiastical tithe (tenth) in France and Provence (to which there was widespread resistance). The clause concerning offices in the papal state was almost immediately ignored to allow Charles to become senator of Rome, shortly before Urban's death.

Urban minimized the Germans involvement in Italian and Sicilian affairs by granting to both Richard of Cornwall and Alfonso X of Castile, in 1263, the right to call themselves "king elect of the Romans." He thus prolonged an interregnum in the Holy Roman empire that had lasted since 1254. He also successfully maneuvered to reduce Manfred's support in Lombardy and Tuscany, which initially posed a severe danger.

Faced with the downfall, in 1260, of the Latin empire of Constantinople at the hands of Michael VIII Palaeologus, Urban declared a tax in 1262 for recovering it, but in most places he failed to collect the tax. He also started negotiations with Michael for a union of the Greek and Latin churches; these negotiations were to lead to an abortive agreement for union at the Council of Lyon in 1274.

Urban V, Pope

Pope Urban V (Guillaume de Grimoard, 1310—1370, r. 1362-1370) had previously been abbot of Saint Victor in Marseille and three times papal nuncio in Italy. Although he was personally frugal, he was a generous patron of both art (notably in embellishing the papal palace at Avignon) and learning—he endowed several universities and founded two, at Krakow and Vienna. In 1364, he compelled Cardinal Albornoz to make peace in the Romagna with Bernabo Visconti, hoping to free resources for a crusade organized by the king of Cyprus. He also hoped to use the mercenary companies on the crusade, but they refused to go. Urban's subsequent vigorous measures against the *condottieri* who remained in France and Italy (he excommunicated them and forbade cities to employ them) were largely unsuccessful. However, the peace he had arranged enabled him to take his curia back to Rome from Avignon in 1367, although he relied on support from Emperor Charles IV to establish order in Italy. The Lateran palace being in ruins, Urban settled at the Vatican, creating a precedent for all future popes. Charles arrived in 1368 but failed entirely to impose his will. In 1370, under pressure from the cardinals, Urban returned to Avignon, where he died.

Urban VI, Pope

Pope Urban VI (Bartolomeo Prignano, c. 1318-1389, r. 1378-1389) had been a curial official. When Pope Gregory XI died in Rome in 1378 shortly after arriving from Avignon, a divided college of cardinals elected Urban to succeed him. Finding the new pope Urban VI intolerably rude and violent, the cardinals slipped away from Rome. Most of them met at Fondi in the Angevin kingdom of Naples and rejected the election as having been coerced by a rioting Roman populace. They chose from among their French majority Robert of Geneva to reign as (anti • pope) Clement VII. This new claimant failed

to drive Urban from Rome and went to Avignon, which he made his residence. Urban named a new group of cardinals, but he soon also alienated them, and some lost their lives for conspiring against him. Nor would Urban heed the advice given to him by Catherine of Siena. This intransigence contributed to dividing Europe into hostile religious camps, usually along the lines of alliances in the Hundred Years' War. Moreover, Urban meddled in the politics of Naples, and he lost most of his political support in Italy. Nonetheless, when Urban died in Rome in 1389, his cardinals were quick to perpetuate the Great Schism by electing a successor from their own ranks. The schism would endure for another quarter-century.

Urbino

Urbino is a city in the Marche, bordering on the Romagna, situated at 1,600 feet (486 meters) above sea level, on the top of two hills between the valleys of the Foglia and the Metauro. The Roman *municipium* was known as Urbinum Metaurense. There are remains of a pool from the Roman era in the church of San Sergio (first home of the bishops of Urbino) and a Roman theater beneath the present Via San Domenico.

Urbino was the seat of a diocese from the fifth century on. The town was besieged and taken from the Goths by Belisarius in 538. Under Byzantine rule, Urbino became an important outpost against the Lombards of Arezzo. In 595, Pope Gregory the Great entrusted Leontius, bishop of Urbino, with the church of Rimini during an illness

of the bishop of Rimini. Urbino was donated to the church and included within the papal state in a treaty of 817 between Emperor Louis I the Pious and Pope Paschal I. In the twelfth century, Urbino was Ghibelline and staunchly loyal to the Swabian emperors.

In 1226, Frederick II gave Urbino as a comital her to the brothers Buonconte and Taddeo of Montefeltro as a reward for their assistance. Under Buonconte's grandson, Count Guido (c. 1220-1298; see Dante's *Inferno*, 27), and his successors, the territory was enlarged, despite the sometimes fierce opposition of the papacy, until it included Gubbio, Cagli, and Casteldurante (now called Urbania). The Montefeltro remained important military captains (*condottieri*) through the fourteenth and fifteenth centuries, when they were often in sharp competition with the papacy and with the Malatesta, the *condottieri* lords of neighboring Rimini. In 1443, Pope Eugenius IV granted the title of duke to the young, weak Oddantonio. However, when Oddantonio died, the papacy did not recognize the title and declined even to grant the accustomed apostolic vicariate. Not until 1474 was the hereditary title of duke finally conceded to Federico of Montefeltro by Pope Sixtus IV. After Federico's death in 1482, the duchy passed to his son, Guidubaldo, who was the last Montefeltro ruler of Urbino. Guidubaldo is the ruler famously described in Baldassare Castiglione's *Book of the Courtier* (in which the discussions were imagined as taking place in 1506).

View of Urbino. Photograph courtesy of John W. Barker.

Much of the medieval town was destroyed to make way for Renaissance building projects, such as the ducal palace (c. 1444-1482) and the fortifications of 1507. Surviving fourteenth-century monuments include the churches of San Francesco, Sant'Agostino, and San Domenico and the oratory of San Giovanni Battista.

Valentinian III

Emperor Valentinian III (Placidus Valentinianus, Flavius Valentinianus; 419-455, r. 425-455) was the son of the emperor Honorius's sister Galla Placidia and the patrician (later emperor) Constantius, and the brother of J usta Grata Honoria. In the early 420s, Valentinian was proclaimed *nobilissimus* ("most noble") by his uncle Honorius, but neither this title nor his father's emperorship was initially recognized in the east. After his mother had a falling-out with Honorius, the young Valentinian accompanied her and his sister to exile at the court of his cousin Theodosius II (401 or 402–450) at Constantinople. The attitude of the eastern court toward Valentinian changed in 423, when the usurper Johannes seized power in the west. Valentinian was first reaffirmed as *nobilissimus* in 423-424 and then named Caesar (junior emperor) in 424. Also in 424, he was betrothed to his cousin Licinia Eudoxia, the daughter of Theodosius II. In 425 Valentinian was proclaimed Augustus at Rome after the defeat of Johannes, and in 437 he returned to Constantinople for his marriage. Merobaudes wrote a poem (now partially extant) in honor of the wedding.

In the early years of his reign, Valentinian was overshadowed by his mother. After his marriage, much of the real authority lay in the hands of the patrician and master of soldiers Aetius. Nor does Valentinian seem to have had much aptitude for ruling. He is described as spoiled, pleasure-loving, and influenced by sorcerers and astrologers. He divided his time primarily between Rome and Ravenna. Like his mother, Valentinian was devoted to religion. He contributed to two churches of Saint Laurence, in Rome and Ravenna. He also oversaw the accumulation of ecclesiastical authority in the hands of the bishop of Rome as he granted ever greater authority and prestige to Pope Leo I (the Great, r. 440-461) in particular.

Valendnian's reign saw the continued dissolution of the western

empire. By 439, nearly all of North Africa was effectively lost to the Vandals, although Valentinian did attempt to neutralize that threat by betrothing his sister Placidia to the Vandal prince Huneric. In Spain, the Suevi controlled the northwest, and much of Gaul was to all intents and purposes controlled by groups of Visigoths, Burgundians, Franks, and Alans. In 454, Valentinian murdered his supreme general, Aetius, presumably in an attempt to rule in his own right. But the next year he himself was murdered by two members of his bodyguard who had been partisans of Aetius.

Although Valentinian was ineffectual as a ruler, his legitimate status and his connection to the old ruling dynasty provided a last vestige of unity for the increasingly fragmented Roman empire. After his death, the decay of the west accelerated. The different regions of the west went their own way, and the last several western emperors, the so-called shadow or puppet emperors, were usually overshadowed by one barbarian general or another and were also limited primarily to Italy.

Valerius Maximus

The Roman writer Valerius Maximus (fl. c. a.d. 20) was of undistinguished origins. He accompanied the proconsul Sextus Pompeius to Asia c. 27. After returning, Valerius wrote (c. 29— 32) a collection of historical anecdotes, *Factorum et dictorum memorabilium libri* (*Books of Memorable Words and Deeds*), which was dedicated to the emperor Tiberius (r. 14-37). This book includes extracts from Cicero, Sallust, Livy, Pompeius Trogus, and others; the extracts are divided into two categories— "domestic" and "foreign"—and are usually concerned with various moral traits. The book is full of rhetorical artifice and is in general a characteristic production of the Latin "silver age." Two epitomes were made in the fourth and fifth centuries, and the work was a popular school text during the Middle Ages.

Vandals

The Vandals are believed to have originated in Scandinavia in the distant past. By the second century after Christ, they occupied the area around Silesia and were divided into the Silings and the Asdings. During the third and fourth centuries, they frequently raided the Roman empire, and some Vandals accompanied Radagaisus in his invasion of Italy in 405. On 31 December 406, a horde of Asding and Siling Vandals, accompanied by Alans, Burgundians, and Suevi, crossed the frozen and unprotected Rhine into Gaul. In 409, all but the Burgundians passed into Spain. In 416, the Silings and Alans were overwhelmingly defeated by the Visigoths. Their remnants then joined the As-dings, whose kings henceforth were known as kings of the Vandals and Alans.

In 428, Gaiseric, who was to become one of the most able Germanic kings of the period, succeeded to the Vandal throne. In the next year, he led an estimated 80,000 Vandals and Alans across to Africa, perhaps having been invited to do so by a disaffected Roman count. In 439, Carthage itself was captured. The loss of North Africa was a disaster for the western empire. Not only did it put much of the grain supply of Italy into enemy hands; it also gave the Vandals an opportunity to take to piracy. Vandal raiders descended on the coasts of Italy, Spain, and even Greece. In 455, Gaiseric went so far as to land at Ostia, the port of Rome. Pope Leo I was said to have met him and prevented an out-and-out sack, but the Vandals nevertheless looted and plundered for fourteen days. They returned to Carthage not only with the spoils taken

by Titus from Jerusalem in A.D. 70 but also with the empress Eudoxia and her daughters Eudocia and Placidia. Placidia was then married to Gaiseric's son Hun-eric.

Unlike the Germanic settlers in Europe, the Arian Vandals had difficulty reaching an accommodation with the local Roman population. They persecuted the Catholics, and many bishops went into exile, often to either Sardinia or Italy. Other Romans also fled to Italy and the east. The Vandal kingdom came to an end in 533, when the emperor Justinian's general Belisarius defeated the last Vandal king, Gelimer, in two battles. Of all the Germans who occupied the Roman empire, the Vandals probably had the least lasting impact.

Vanni, Andrea

Although a number of Sieneese paintings are attributed to Andrea di Vanni d'Andrea (fl. c. 1332-1414), he is not a well-known painter. He was active in Siena, and his work is found in frescoes and panel paintings; but his birth and death dates remain unknown, and even his relationship to his contemporary Lippo Vanni has not been clearly established. Andrea is identified as sharing a workshop with Bartolo di Fredi for two years (1353-1355). Berenson (1968) identifies only one of

Andrea Vanni's works as signed, a triptych of the *Agony in the Garden*, *Crucifixion*, and *Descent into Limbo* (Washington, Corcoran Gallery, c. 1383). In 1370, he was working on mages of the Blessed Andrea Gallerani with Antonio Veneziano in the *duomo* of Siena. Andrea Vanni is last documented on two trips to Naples in 1375 and 1383, but other works are attributed to him well after these dates.

Andrea Vanni's work shows the strong influence of many well-known Sieneese painters of the first half of the century: Lippo Memmi, Simone Martini, and the Lorenzetti brothers. His conservative stylistic approach, however, appears to have been governed by choice rather than by social or historical circumstances; evidently, then, his style was accepted and found a market during the period after the plague. Frescoes formerly attributed to him or to Simone Martini are now attributed to Bartolo di Fredi, indicating a parallelism of styles among the Sieneese workshops.

Andrea Vanni's work centers in Siena, where he is known to have been active from the 1350s through the first decade of the fifteenth century. Among his most important Sieneese works are the following: frescoes painted in the Sala dei Cardinali (Palazzo Pubblico), which bear the partial date "136—"; a *Madonna Lactam* in the church of San Donato; a fresco of Saint Catherine of Siena in the Cappelle delle Volte in San Domenico; and three panels from a polyptych of Saint Anne holding Mary, Saint Ursula, and Saint Agnes. Works of his have also been identified in the environs of Naples at Aversa, in the Cappella di Casaluce, dating from his trip to this region in 1375. These frescoes include scenes of the *Dormition* and *Assumption of the Virgin*, accompanied by representations of saints Anthony Abbot and Catherine of Siena. A work dating from 1398 was painted in collaboration with Giovanni di Paolo in the first chapel to the right of the choir of San Francesco. It was followed by a polyptych for the high altar of Santo Stefano in the tradition of Duccio's *Maestà*. This large altarpiece portrays an *Enthroned Madonna and Child with Fourteen Saints and the Four Evangelists*. Andrea Vanni's early relationship to Bartolo di Fredi becomes apparent when one compares his *Adoration of the Magi* (New Orleans, Isaac Delgado Museum, Kress Collection) with panels of the *Adoration* by Bartolo. Both of them seem to have influenced the *Strozzi Adoration* (Florence, Uffizi) by Gentile da

Fabrizio (c. 1370— 1450), in their Lorenzettian conflations of the iconography with the misbehaving animals in the background and orientalizing motifs. Even the saddle on which Mary is sitting represents as much a departure from conventional Sienese images of this subject as the altar on which Gentile places his Madonna and Child. Another work attributed to Andrea Vanni is a Madonna in the Palazzo Comunale in Seggiano.

Andrea Vanni's oeuvre is closely linked to that of his predecessors Simone Martini, Lippo Memmi, and the Lorenzetti, and to that of his contemporaries Luca di Tommè and Giacomo di Mino; it is thus at the hub of fourteenth-century Sienese painting.

Vanni, Lippo

Lippo Vanni was born in Siena and raised in the Siennese artistic traditions of the early *Trecento*. He emerged as one of the city's masters of illusionism. His earliest work appears to be largely in miniatures, but he went on to wall frescoes and panel paintings. He is first documented in 1344, when he was commissioned by the *spedale* (hospital) of Santa Maria della Scala to paint an illuminated book. He was then accused of having taken and pawned a chorale book owned by the hospital, and a court order and soldiers were necessary to retrieve the book—an episode suggesting that Vanni either was a thief or was embroiled in a dispute over his wages.

Lippo Vanni's style reflects strong influences from Lippo Memmi, the Lorenzetti brothers, Simone Martini, and the miniaturist Niccolò di ser Sozzo Tegiiacci. For example, the painted cover of a *gabella* (city tax book) of 1345, formerly attributed to Ambrogio Lorenzetti, is probably the work of Vanni; their styles are very close. Among Vanni's earliest works are miniatures in the *corale* of *Libro dei Conti Correnti* (1345; Siena, Opera del Duomo, Corale n. 4), the Gradual for the Collegiata at Casole d'Elsa (c. 1345-1350), the Berry Antiphonary (Fogg Museum, Cambridge, Massachusetts), and a roundel held by angels over the entrance door to the monastery church of Lecceto. Works attributed to Vanni from the period 1350-1360 include a *Madonna and Child* (Perugia, Galleria Nazionale dell'Umbria); a seminary chorale book (Siena, Seminario Pontificio Pio XII); an antiphonary (Siena: Opera del Duomo); and a fresco of the *Madonna and Saints* for the seminary in Siena, which presents itself as though it were a regular polyptych with gilded wooden frame and other details. For the monastery church of Santi Domenico and Sisto in Rome, Vanni painted the triptych of Saint Aurea, showing the Madonna and child enthroned with saints Aurea and Dominic and angels; Eve is seated at the feet of the Madonna, and the tempter serpent is writhing on the floor. This unique work is signed and dated (1358). Between 1360 and 1370, Vanni decorated the

triumphal arch over the choir and painted a series of frescoes depicting the life of the Virgin at the church of San Leonardo al Lago, in the province of Siena. Lippo also painted a reliquary triptych of saints Dominic, Peter Martyr, and Thomas Aquinas (1372-1374; Vatican Galleries, Museo Cristiano). Another reliquary triptych (in the Walters Art Gallery, Baltimore) dates from c. 1374-1375. Vanni painted in grisaille the *Battle of Torrita in the Val di Chiana* in the Sala del Mappamundo of the Palazzo Pubblico in Siena (1363) and worked on the vaults of the *duomo* with Antonio Veneziano (1369-1370). In 1372, Lippo executed a fresco of the Annunciation in the church of San Domenico in Siena.

Veneziano, Paolo

The earliest undisputed date for Paolo Veneziano (died c. 1362) is 1333, when he signed and dated a triptych, the *Dorrnition of the Virgin*, formerly at San Lorenzo in Vicenza and now in the civic museum there. An art collector in Venice mentions him in a memorandum of 1335. His *Madonna and Child Enthroned* in the Crespi collection in Milan is signed and dated August 1340. A signed deposition by Paolo of March 1341 is in the Venetian archives, where there was once a document of September 1342 commissioning a throne for use in a state festival from a painter named Paolo. This Paolo, who appears to be the same artist, enjoyed official status at the time. In April 1345, Paolo and his sons Luca and Giovanni signed and dated a panel used to protect the enamel and gold Pala d'Oro on the high altar of the basilica of San Marco. The cover, which is still in place, depicts episodes from the legend of Saint Mark, with half-figure saints and the *Man of Sorrows* above. A Venetian archival document of January 1346 records payment to Paolo for an altarpiece for the chapel of Saint Nicholas in the ducal palace; two scenes from the life of Nicholas in the Soprintendenza at Florence may have once belonged to it. An *Enthroned Madonna and Child* at Carpineta in the Romagna bears Paolo's signature and the date 1347. A document of April 1352 in the archives at Dubrovnik relates to an altarpiece by him which is now lost. In 1358, Paolo and his son Giovanni signed and dated the *Coronation of the Virgin* now in the Frick Collection. Paolo died sometime between then and September 1362, when a Venetian archival document mentions him as deceased.

A large body of undocumented work is attributed to Paolo and his workshop, which is known to have included his sons Luca, Giovanni, and probably Marco, and at least one other artist. This body of work may be divided into two groups. One group falls within Paolo's documented career and is widely accepted, although with differences of opinion concerning chronology and autograph share; the other group is placed before that and is controversial. Important works among the former group are as follows: the votive tomb lunette of Doge Francesco Dandolo in Santa Maria dei Frari in Venice, painted around the time of the doge's death in October 1339; the *Enthroned Madonna and Child*

with angels and donors in the Accademia in Venice, probably c. 1340; the polyptych from Santa Chiara in the same museum, depicting the *Coronation of the Virgin* and scenes from the lives of Christ, Saint Francis, and Saint Clare, probably from the early 1340s; a dismembered polyptych in San Giacomo Maggiore, Bologna, possibly c. May 1344, when the church was consecrated; a crucifix in the church of Saint Dominic at Dubrovnik, probably the one mentioned in a document of March 1348; dated polyptychs of 1349 at Chioggia, 1354 in the Louvre, and April 1355 formerly at Piran in Istria; and another late polyptych, dismembered, at San Severino in the Marches.

The other group of works, which is a subject of debate, should be attributed to Paolo's early period. It includes the panel masking the sarcophagus of the Blessed Leo Bembo, dated 1321, once in San Sebastiano, Venice, and now at Vodnjan in Istria; the dated *Coronation of the Virgin* of 1324 in the National Gallery in Washington; five panels from the early life of the Virgin and her parents at Pesaro; an altarpiece with half-length Madonna and child and four scenes from their lives in San Pantalon, Venice; sixteen panels from the legend of Saint Ursula in the Volterra collection in Florence; and a polyptych with an image and narrative of Saint Lucy, originally in her church at Jurandor and today in the bishop's chancellery at Krk in Dalmatia. The undated works were apparently done during the 1320s, in the order listed. The painted donor figures in a wood relief of 1310 at Murano have also been ascribed to Paolo, but they seem too early to have been painted by him and may show the hand of his master. It also has been suggested that Paolo and his workshop illuminated manuscripts and designed or executed mosaics and embroideries.

Although a long Venetian mosaic tradition survived into the fourteenth century, relatively little work on panel or in the other pictorial media was produced in the period immediately before Paolo. The traditional view is that Paolo was the founder and first great master of Venetian *Trecento* painting, and this view would have to be upheld unless the works assigned to him before his documented activity are rejected. Some of these works, particularly the panels at Pesaro, show the direct influence of Giotto's frescoes in nearby Padua; others, such as the *Coronation of the Virgin* in Washington, show the intrusion of Gothic style and iconography into the local Byzantine tradition. These

same ingredients—the Byzantine, the Gothic, and the Giottesque— are the fundamental elements in Paolo's later works, in which the Gothic becomes more pronounced. The Byzantine and Gothic are so harmoniously blended as to suggest their ultimate common source in the distant classical past; the same might be said of the Giottesque. The influence of the Saint Cecilia Master and the school of Rimini may also be detected. The published literature assumes that, despite the obvious similarities, Paolo attained his style independently of direct Siennese influence. Such examples as his Accademia *Madonna*, which is close to Duccio's in the Pinacoteca at Siena; and his figures of Saint Catherine in the Sanseverino polyptych and in a panel at Chicago, which resemble Simone Martini's fresco of that saint at Assisi, suggest otherwise. The bold patterns and glowing colors give Paolo's paintings an opulence unequaled even by the Siennese.

Paolo Veneziano had a profound influence on Venetian pictorial art, particularly panel painting, until the end of the fourteenth century. The style that he instituted was continued by Lorenzo Veneziano (whose dated works range from 1357 to 1372) and others into the fifteenth century and the international Gothic style. Paolo had relatively little influence on the mainland, which, with the exception of Istria and Dalmatia, responded to more progressive artistic stimuli.

Venice

Physical Characteristics and Evolution

The city of Venice is a product of its geography. People settled on the unstable islands where the rivers of northern Italy meet the Adriatic Sea. These islands have been formed, since the last ice age, from rock and silt brought down by rivers and dumped where the tides from the sea meet the freshwater rivers. A row of barrier islands (the *lidi*) protect the lagoons from the open sea, but the salt water enters into the lagoons daily through the openings in the *lido* at Chioggia, Malamocco, and San Nicolò di Lido. Two types of river enter the lagoons. Swift-flowing rivers (the Tagliamento, Livenza, Piave, Sile, Brenta, and Bacchiglione) rush down from the Dolomite Alps in the north and bring silt and small rocks to deposit before the incoming tides. The rivers coming from the west, which drained the plain of northern Italy (the Adige and the northernmost branch of the Po), move more slowly yet inexorably, bringing finer silt. Against these flows, the saltwater tides enter the lagoons daily from the Adriatic and retreat, scouring the lagoons in channels and cleansing the waters to create a healthy environment in which people can live. On occasion, however, the tides become much higher (*acqua alta*) and inundate the low-lying islands. On other occasions, the rivers hurry into the lagoons with springtime force, causing flooding. As these flows vary from year to year, channels are created or abandoned by the sea and the islands are raised or, more frequently, subside into the brackish waters. Earthquakes also occasionally threaten the lagoons.

Into this unstable environment came humans. History and archaeology combine to demonstrate that the islands of the northern Adriatic have been inhabited since prehistoric times. The environment of the lagoons stimulated settlement. The brackish waters sheltered fish and birds. Salt could be evaporated from its waters. In addition, the complex of sinuous channels gave protection from invasion by mainlanders and encouraged seafaring. Places that were inhabited in classical times have since become landlocked; for example, the ancient

seaports of Ravenna, Spina, Padua, and Aquileia are now far from the Adriatic Sea. In the seventh century, the ancestors of present-day Venetians built their homes farther out in the lagoons, some in places that are uninhabitable today. Up to the ninth century, as we know from only scarce documentation, these early communities grew and then declined as people moved farther out to other islands. In the ninth century, if not before, the complex of islands 2 1/2 miles (4 kilometers) from the mainland, known as the Rial to (the *rivo alto*, or high bank), became the political and social center of life in the lagoons.

How were buildings constructed on such uncertain land? First, great numbers of poles were driven down into the mud. On top of these were placed platforms of wooden boards and then stone for the foundation of structures. Archaeologists have reported finding wood, stone, and ceramic from layers of mud dated to the sixth and seventh centuries in the lagoons, suggesting the strength of these early settlements. Houses of wood with thatched roofs alternated with gardens, fields, and fisheries, and with watercourses and swamps. By the early thirteenth century, among the great stone structures that had been built were the basilica of San Marco; the churches of San Lorenzo, San Giovanni Decollato, and San Nicolò dei Mendicoli; and the great homes of the Ziani, Bernard us Teutonicus (the German merchant), and Renier Dandolo, son of the doge.

The Venetians recognized the precariousness of their environment. In its earliest official records, the Venetian commune concerned itself with the preservation of the environment. Since the salubrity of the air and the water of the lagoons depended on the daily washing by the saltwater tides, the Venetians attempted to defend the tidal waters and to prevent the narrowing of the lagoons. It was observed that "a large lagoon makes for a great seaport" (*gran laguna fa gran porto*). Venetians understood that the action of the tides and the deposit of silt from the rivers raised the bottom of the lagoons and created more land. The lagoons also narrowed when people extended the shorelines in order to create more land for agriculture or for buildings. In the fourteenth century, the Venetian republic began to divert the river mouths away from the lagoons so that they emptied into the Adriatic north and south of the lagoons. Furthermore, the republic ordered regular dredging of the channels in the city so that the waters would

flow more freely. In the Renaissance, the Venetian republic tried to save the lagoons from silting up by prohibiting the dumping of debris to create more land on the marshes and the mudflats. Thus the Venetians tried to maintain their residence in this inherently unstable environment. The efforts to control this instability increased in the Renaissance and continue to this day.

Today there are 118 islands and more than 200 canals within the heart of the ancient city. The Grand Canal winds in a reverse S-shaped curve over 2 miles (3 kilometers) through the city; the canal is more than 12,000 feet (3,800 meters) long, 100 to 230 feet (30 to 70 meters) wide, and 18 feet (5-5 meters) deep. Forty-five channels (*rii*) open onto the Grand Canal. Today it is a concern of the world that this unique environment be preserved for its historic heritage.

History and Government

Romans had visited the lagoons in the pre-Christian era, but the historical record does not confirm settlements until A.D. 537-538, when Cassiodorus mentioned that men from the lagoons supplied Ravenna with salt. After 586, mainland Romans began to flee to the lagoons before the invading Lombards. Roman leaders from Padua settled Chioggia and Malamocco; those from Roman Altino colonized the island of Torcello. People from Opitergo (Oderzo) founded Eraclea (or Cittanova), named for Emperor Heraclius. These centers were separated from each other by marshes, channels, and brackish lakes.

Whereas the mainland became part of the Lombard kingdom, the lagoons honored Constantinople's representative in Italy, the exarch of Ravenna. He appointed dukes chosen from the local tribune class. In the early eighth century, when the Lombards threatened Ravenna, Paolo (or Paulicio) in Eraclea became the first locally chosen duke. He soon transferred his seat to the more defensible Malamocco on the *lido*.

The metropolitan of the Christians had also fled mainland Aquileia and established Grado as his seat. He became known as the patriarch of Grado, and he built the basilica of Santa Eufemia there in the sixth century. Torcello's basilica of Santa Maria Madre di Dio was begun in 639.

Church of Santa Maria Gloriosa dei Frari, Venice. Photograph courtesy of John W. Barker.

Nominal ties with Constantinople continued for several centuries. Eighth-century dukes in Malamocco were often removed in violent factional strife. Only eight times in the first three centuries were the dukes chosen peaceably, usually from the Particiaco, Candiano, and Orseolo families. All other changes were violent.

When the Carolingians attempted to conquer Italy, the settlements on the lagoons asserted their autonomy. In 810, Charlemagne's son Pepin tried to conquer the lagoons, but he met the determined opposition of the men from Malamocco, assisted by a Byzantine fleet. By mid-century, both Carolingians and Byzantines recognized that the lagoons were autonomous; they had become a cushion between the western and the eastern empires. Their duke (pronounced *doge* on the lagoons), a genuine representative of local autonomy, moved his center from Malamocco to the Rialto, seat of the bishopric of Olivolo. Now the settlements on the lagoons began to bear the name Venice. In 828, two Venetians transferred the relics of Saint Mark the Evangelist from Muslim Alexandria to the Rialto. Their placement in a new ducal chapel legitimized the doge, but civil strife 150 years later would damage his chapel.

Doge Pietro II Orseolo (r. 991-1009) established his authority over the upper Adriatic by leading a naval demonstration to Istria and Dalmatia

in the year 1000. This doge also made treaties with all the Muslim powers of the Mediterranean littoral and achieved recognition from both western and Byzantine emperors. Doge Domenico Contarini (r. 1042-1071) confirmed ducal authority by initiating the reconstruction of the ducal chapel, which became the basilica of San Marco, housing the relics of the evangelist. Each new doge at his election was acclaimed by all the people, and lauds were sung in his name in the basilica of San Marco. Eleventh-century doges, however, continued to bear Byzantine titles.

In the tenth and eleventh centuries, judges drawn from among the better class (*maiores*) assisted the doge in his curia. The local neighborhoods maintained their own bridges, wells, shorelines, and night watches. With Doge Domenico Selvo (r. 1071-1084), a circle of the leading men dominated the popular assembly (*arengo*). They represented the collective will; they elected the doge, whom they usually chose, during the twelfth century, from the Falier or Michiel family. About 1143, Venice became a commune, led by the doge and a committee of judges known as the *sapientes*. But the popular assembly took matters into its own hands in 1172 and assassinated Doge Vitale II Michiel on his return from an unsuccessful punitive expedition against Constantinople. Leading merchant aristocrats reestablished order and elected their own Sebastiano Ziani as doge. They also replaced the popular assembly with a "great council," whose members included only the important families, officeholders, and former officeholders of the commune. The six *sapientes* (ducal councillors) became the "little council." Each doge after 1192 was required to take an oath of office (*promissio ducale*), which increasingly limited the ducal powers.

The doges of the early Venetian commune were remarkably strong leaders. Doge Enrico Dandolo led the commune in accepting the invitation of Flemish crusaders to participate in a crusade. This Fourth Crusade climaxed in 1204 with the capture of Constantinople and the beginning of Venice's overseas colonial empire. In the first half of the thirteenth century, the doges codified the laws of Venice.

Venetian interests in the eastern Mediterranean increased greatly during the thirteenth century, when Venice waged two wars with its commercial rival, Genoa. At home, the government became more rational. The organs of the commune formed a pyramid, with the

general assembly at the base. Above it, the great council held the most power, electing all officials of the government, passing laws, and sitting in judgment on civil matters. A new council, called "the Forty" (*quarantia*), assumed responsibility for legal appeals, prepared the agenda for the great council, and controlled finances and the coinage. Later in the century, the sixty men who supervised commerce, naval, and foreign affairs were organized as the senate (*consilium rogatorum* or *consiglio dei pregadi*). When appropriate, the Forty and the senate acted jointly.

Above these councils sat the ducal council or *signoria*, which included the doge, his six councillors, and the three heads of the Forty. They initiated governmental activities and officiated during crises, but they also had to obey the other councils. Most magistrates held office for one year or two, except for the doge, who held office for life. The doge presided over all the councils, providing continuity for the commune. The doge was head of state, but he was an elected leader and was restrained by the prohibitions specified in his oath of office. On completion of their terms, the doge and all other officials were subject to detailed examination of their work in office by the public prosecutors (*avogadori de' comun*) and subject to punishment if they had misused their office. A doge's heirs were responsible for his acts. Elected officials continued to multiply in the thirteenth century as the state became more influential in the lives of its citizens.

It is estimated that by the end of the thirteenth century, 100 public officials were elected annually by the great council, comprising varying numbers of patricians. In 1297, Doge Pietro Gradenigo led the commune to adopt new legislation, the *Serrata* ("closing"), which defined the membership of the great council. Members of the council, descendants of members, and men who held office in the commune were accepted. After the *Serrata*, membership in the great council defined a family as a member of the Venetian ruling class, the patriciate, the nobility. Only patricians could hold high office.

Two conspiracies called this reform into question. First, certain commoners under Marino Boccono disputed the reforms, but Boccono was hanged in 1300. More serious was the conspiracy of 1310, led by three patricians—Bajamonte Tiepolo, Marco Querini, and Badoero Badoer. They organized a three-pronged military assault against the center of government, the Piazza San Marco. However, Doge Gradenigo, who had received a warning, defeated the insurgents with the assistance of loyal patricians and workers from the arsenal. When Tiepolo's standard-bearer was struck by a mortar dropped from a window, he and his forces retreated to their palaces. Querini was killed; Badoer was captured and executed. But because Tiepolo was very popular and because both his grandfather and his great-grandfather

had been doges, the commune sentenced him to perpetual supervised exile. To enforce this sentence leniently and to suppress any further plots, the commune created a special "council of Ten." Its members were elected annually from the great council and could act secretly and quickly. Their ability to act decisively made them one of the most important organs of the commune in later centuries.

Citizens of Venice, who were not enrolled in the patriciate, staffed the civil service from the fourteenth century on. One of them was grand chancellor to assist the doge. In the second half of the thirteenth century, the great council recognized the existence of many craft guilds. These checks and balances characterized the commune of Venice and ensured its stability.

During the fourteenth century, Venice was challenged by wars with Ferrara and with the king of Hungary, by insurrections in Crete against Venetian rule, and by two more wars with the Genoese. The Scaligeri despots of Verona and the Carrara of Padua in turn challenged Venetian domination of the rivers emptying into the lagoons. Also during this century, flooding from high tides threatened the lagoons in 1314, 1342, and 1386. The bubonic plague struck Venice fiercely after a Venetian galley returning from the Crimea in the autumn of 1347 brought the black death. Venice suffered for eighteen months, losing perhaps three-fifths of its population. The plague struck again in 1350, 1382, 1393, and 1395. Despite these challenges, the government structure held firm.

The third war with Genoa (1350-1355) strained the resources of the commune, which was then led by the humanist Doge Andrea Dandolo, a friend of Petrarch's. Marino Falier, the next doge (r. 1354-1355), although an experienced administrator and admiral, attempted to overthrow the aristocratic councils of Venice and become sole ruler. When his conspiracy was discovered by the ducal councillors, he was beheaded at the Giant's Staircase in the palace of the doges.

Twenty-three years later, Venice endured the most extreme challenge to its independence since Charlemagne—its fourth war with Genoa (the war of Chioggia, 1378–1381). Following the peace of Turin, Venice survived to limp back to mercantile and political strength, but Genoa lost its independence. In the 1390s, when the Carrara of Padua again threatened Venice, the commune allied itself with Gian Galeazzo Visconti to defeat the Carrara. Venice took Padua and executed its

rulers. As a result, Venice added Padua, Vicenza, and Verona to its dominion in 1404-1406. Thus began the mainland extension of the Venetian state.

Trade and Empire

Seaborne commerce caused the growth of Venice. Early residents of the lagoons caught fish, hunted waterfowl, and collected the salt evaporating along the Adriatic, which they exchanged for products of the mainland. By the tenth century, Torcello in the lagoons was an important Adriatic seaport. The Lombard and Carolingian rulers in Pavia bought incense, silks, and spices from the merchants of the lagoons, who "neither sowed nor reaped and bought all their grain from others." Little documentation survives to describe this early Venetian trade.

Regular contacts were maintained between the Rialto and Constantinople throughout the early centuries, while Venice remained subject to the eastern Roman empire. The emperors attempted to suppress Christians' trade with Muslims in time of war. Venetian fleets assisted the Greeks against the Muslims on the Adriatic in the ninth and tenth centuries, when Muslim fleets attempted to close the Adriatic and even pillaged Grado on the lagoons. In 992, the Byzantine coemperors Basil II and Constantine VIII granted Venice relief from the special port taxes in the Sea of Marmara, although the Venetians were expected to abide by other Byzantine laws.

Relations between the ducal family and the Byzantine imperial house became closer in 1102, when the son of Doge Pietro Orseolo II married the niece of Emperor Basil II, and when doge Domenico Selvo (r. 1071 — 1084) married Theodora, the sister of emperor Michael VII. She scandalized the Venetians by her fastidious cleanliness, her use of a fork to convey food to her mouth, and her perfumes.

In 1082, Emperor Alexis I Comnenus granted the Venetians exemption from all tolls in Byzantine ports. They also obtained a protected quarter in Constantinople itself and trading privileges in the Byzantine seaports on the Aegean and Ionian Seas. In return, Venice allied itself with Byzantium to defend Byzantine Durazzo against their

common enemy, Robert Guiscard. With these privileges, Venetian merchants had an enormous economic advantage over all other foreign traders and over the Byzantines themselves. Much of the Venetians' commercial profit came from their business in Romania (the Greek east). From this time, Byzantines began to depend on Italian sea power, rather than on their own war fleets, and the Greeks were forced to recognize the relative autonomy of the lagoons.

Venetian overseas trade increased greatly during the crusades, 1095–1291. Fleets from Venice assisted the crusaders at the conquest of Haifa in 1100 and at Sidon in 1110. A Venetian fleet defeated a large Egyptian fleet in the waters off Ascalon in 1123 and assisted in the capture of Tyre the next year. Consequently, the Latin kings of Jerusalem granted Venetians special quarters in the crusader cities. Venetian merchants concentrated their Syrian-Palestinian business in Tyre but also had privileges in Acre, Jaffa, and Ascalon. The Christian lords of Syria granted Venetians some privileges in the northern Syrian seaports where the Pisans and Genoese were more strongly entrenched.

Venetians also traded with Egypt during the crusades, as they had done for centuries. Crusading warfare interrupted this trade whenever Venetian fleets sailed to assist the Latin kingdom of Jerusalem, but the profits to be made in the markets of Alexandria and Damietta attracted the Latins again as soon as peace returned. Unlike Constantinople or the seaports of the crusading states, the Egyptian ports did not offer extraterritorial privileges to the Venetians during the twelfth century. Venice probably had no permanent settlement in Egypt until the thirteenth century. Venetians could, however, travel and do business there. Saladin's successor al-'Adil, in 1208, granted men of Venice two marketplaces in Alexandria where they could conduct business, drink wine, and eat pork. Subsequent commercial treaties in 1238, 1254, and 1264 further defined Venetians' privileges in Egypt, and the commune posted a consul there to represent transient Venetian merchants before Egyptian authorities.

The Venetian trading pattern during the crusading centuries revealed the realities of medieval commerce. Before the compass and the cog came into general use in the late thirteenth century, shipping across the Mediterranean was usually confined to the warmer months. Voyages to and from the Aegean, Constantinople, and the crusader states would be

accomplished in one season, but the longer voyage to and from Egypt usually required an overwinter stay. The heavier cargo (grains and metals) traveled on round ships propelled by sails; but the smaller, shallower galleys with oars and sails carried luxury products of small volume. Merchants would form partnership contracts (*commenda* or sea loans) for a single voyage, and the profits would be divided at the end of the trip. Some families held property in common, and their overseas business would continue for several years before settlement. A senior merchant residing in Venice would send a junior partner overseas to carry out the contract. Venetian agents overseas, who lived in Venetian compounds in foreign ports, assisted in the business negotiations. As many as 10,000 Venetians were residing in Constantinople in 1171.

What were the products of this overseas trade? Venetians carried from Europe its woolen cloth, lumber, wooden utensils, and metals (copper, tin, iron), and also some bullion. Although the doges prohibited the slave trade across the Mediterranean, Venetians did participate in it. In Constantinople they purchased local luxury products: silk fabric, ivories, ornamental metalwork, enamels, and mosaics; in Syria-Palestine, they bought sugar, dates, raw silk, and fine cotton fabrics. Into the crusader states and Egypt came luxury spices (galingale, nutmeg, cloves, rhubarb), pearls and other precious stones, silks, camphor, and musk from the far east. After the Fourth Crusade, the luxuries from farther Asia were loaded onto Venetian ships in the Black Sea, Cilician Armenia, the Turkish ports of western Anatolia, and Egypt. Egyptian markets also furnished raw cotton while Constantinople, Crete, and the Black Sea provided foodstuffs (wheat, barley, oats, millet, cheese, and sugar).

Products were priced by agreements between the parties in the local money of each seaport. Byzantine *hyperpera* served markets of Romania; gold bezants (solidi) of the Latin kingdom of Jerusalem served the crusader states; and Egyptian bezants circulated along the Nile. At home, Venetians used money struck in other Italian communes until the last decades of the twelfth century. The first truly Venetian coin, a penny (*denarius*), was struck in the 1170s; the more successful, larger, purer *grosso* appeared in 1194. During the thirteenth century, the *grosso* achieved ever greater acceptance in the eastern Mediterranean. Gold coins of Florence and Genoa began to supplant the Byzantine gold

hyperpera in the west after 1252. Not until 1284 did Venice strike its gold ducat at the same weight and fineness as the florin. In the fourteenth century, this gold ducat achieved international acceptance. By 1400, the Venetian gold ducat, famous for its stable weight and purity, had conquered all the markets in the eastern Mediterranean

Each Venetian overseas compound (*fondaco*) was fortified. There the traveling merchant could stay for a time, store his merchandise, and enjoy the company of his fellow Venetians. These compounds usually also had bake ovens and a chapel, and they retained the standard for Venetian weights. Sometimes Venetian holdings extended outside these compounds, as at Tyre and Constantinople.

Constantinople was the largest of the twelfth-century Venetian colonies, owing to the extraordinary privileges Venetians held in Byzantium. In 1119, the emperor John Comnenus refused to renew the Venetians' privileges; consequently, the Venetian fleet plundered Greek ports in the Ionian and Aegean, forcing the emperor to renew the privileges in 1126. Although the privileges were renewed again in 1148, the Byzantines were beginning to play off the Genoese and Pisans against the Venetians. In Constantinople, Venetians, Pisans, and Greeks rioted against the Genoese in 1162. Nine years later, the Byzantines suddenly imprisoned all Venetians in Constantinople and confiscated their goods. In 1182, the emperor proceeded similarly against the Pisans and Genoese, whereupon Venice once more sought its former privileges from the Greeks. Byzantium gave Venice some satisfaction in 1183 and 1187, and still another emperor reconfirmed the Venetians' privileges in 1198.

Relations between Venice and Romania changed dramatically with the Fourth Crusade, 1201-1204. Flemish and French knights came to Venice in 1201 to obtain transportation on a crusade. Venice agreed to provide ships, transportation, and food for 33,500 men and horses for one year, in return for 85,000 silver marks. The Frankish crusaders who gathered in Venice in 1202, however, were far fewer in number than had been anticipated. The Venetians had prepared 50 galleys and 450 transports for the anticipated crusade to be led by Boniface of Montferrat. To pay the cost of the fleet, the crusaders agreed to assist Venice against its Dalmatian possession, Zara, which had revolted. Enrico Dandolo, the Venetian doge, then took the cross along with

many other Venetians. After subduing Zara, the crusaders received a new proposal from a Greek prince, Alexios. He offered to provide more troops, supplies, and money to the crusaders and to unite the eastern and western churches if they placed him on the imperial throne of Constantinople, removing a usurper. After much discussion, the leaders agreed to redirect the crusade to Constantinople. They sailed. On arriving at Constantinople, the crusaders were jeered, but they did enter the city. The usurper fled, and the crusaders installed young Alexios and his blind father on the imperial throne. When the Greeks would not honor Alexios's promises to assist the crusade, the crusaders circumspectly withdrew from the city. Yet another Byzantine prince deposed and murdered young Alexios and his father and took the throne. At this, the crusaders massed their forces and took the city by storm in April 1204. Afterward, they sacked the city for three days. The crusaders' cruelty and devastation in Constantinople have been long remembered by the Greeks.

After the sack, the crusaders and Venetians carried out the terms of their previous agreements. The booty was collected, and three-fourths of the first 200,000 marks of booty was given to the Venetians to pay for their fleet while the Franks received the other fourth. The rest of the booty they split evenly. Twelve electors then chose Baldwin of Flanders as the future Latin emperor of Constantinople, according to the contract, and the office of Latin patriarch of Constantinople was awarded to Venice. A committee of twelve Franks and twelve Venetians produced the "treaty of partition" (October 1204), which divided the vast Byzantine empire according to an agreed-on ratio: one-fourth of the Greek lands to the Latin emperor, three-eighths to the Franks, and three-eighths to the Venetians. The committee awarded the Venetians the Thracian coast and the inland area as far as Adrianople; much of mainland Greece, including the Morea (Peloponnese); the Aegean islands; the Ionian islands; and the Dalmatian coast, with its islands. However, except for Constantinople, all these remained in Greek hands. As Venetians took possession of some of these lands, the Venetian colonial empire was born.

From 1205 to 1261, the Latin emperors in Constantinople relied on Venetian sea power and financial strength for their existence. In Constantinople, Venice regained its special commercial and legal

privileges and the Venetian *podestà* was second only to the Latin emperor. Venetians composed half of the imperial council. Venetian ships could sail freely into the Black Sea. They temporarily took possession of the ports on the Sea of Marmara and the straits of the Dardanelles. Venetian naval strength predominated in these waters during the Latin empire.

Outside the immediate environs of Constantinople, the Venetians did not extend their control over all places awarded them by the treaty of partition. A fleet from the commune took Ragusa, Durazzo, the Ionian Islands, Moron, and Coron in the Morea; but the Greek despot of Epirus captured Durazzo, Corfu, and Cephalonia within a decade. Venice never held the inland Morea but tenaciously kept and fortified its southwest promontories, Modon and Coron.

The commune of Venice purchased the large island of Crete and rights in Negroponte (Euboea) from the marquis of Montferrat in 1204. Military expeditions and permanent military colonists from Venice established the authority of Venice in Crete against challenges from Genoese pirates and local Greek lords. Crete became the largest and most populous Venetian colony. Negroponte also came under Venetian influence, since the three gentlemen from Verona who were Montferrat's vassals needed the advice, credits, and naval protection of Venice.

Venetian citizens, with their own privately financed and privately equipped expeditions, took possession of certain other Aegean islands. Marco Sanudo conquered Naxos and its neighboring islands in the Cyclades beginning in 1207. He and his heirs became independent dukes of the archipelago. Sanudo awarded Andros to his cousin Marin Dandolo. The Ghisi brothers, Andrew and Jeremiah, captured the northern Sporades (Mykonos, Tenos, Skyros, Skiathos, and Scopelos) in 1207. Filocalo Navigaioso held Lemnos as megaduke under the Latin emperor. Jacopo Viaro held Cerigo, and Marco Venier held Cerigotto. These men were independent lords in the Aegean, but they were also citizens of Venice. Recent scholarship has demonstrated that not until the fifteenth century did Venetian noblemen begin to control the islands of Anaphe, Astypalaea, Carpathos, Chios, Cyprus, Seriphos, Thera, and Therasia.

With these holdings, Venetian strength and influence prevailed along

the routes from Venice to Constantinople, Syria, and Egypt. Genoa challenged the Venetian colonial empire in four wars. In the first war (1257-1270), the Genoese and Venetians fought over the markets of Acre and over control of the sea lanes. Venice won victories at Acre in 1258, at Settepozzi in 1262, and at Trapani in 1266. Peace was made in 1270 when King Louis IX of France intervened to provide transportation for the forces of his last crusade.

During these hostilities, in 1261, Genoa, in the treaty of Nyrnphaion, agreed to assist Michael VIII Palaeologus, the Greek emperor of Nicaea, in recovering Constantinople. The Latin empire fell to the Greeks the same year, when one of Michael's lieutenants took Constantinople in the absence of the Venetian fleet. Genoese ships then protected the restored Byzantine empire and gained the Venetians' former profitable commercial privileges. Michael, mistrusting the Genoese, readmitted Venetians to Constantinople in 1269, but he did not reaffirm all their former privileges in the city.

After 1261, the Venetians trailed the Genoese in exploiting the Black Sea. Venetian merchants did establish themselves in the Crimea and the Sea of Azov, and after 1291 in Trebizond. Marco Polo traveled from Venice to China via the Black Sea and stayed for twenty years before returning to Venice. His return to Venice was rerouted owing to Venice's second war with Genoa. During this war (1294-1299), Genoese fleets defeated the Venetians off Lajazzo in Asia Minor and off Curzola in the Dalmatian coast. Even the Byzantines joined the Genoese against Venice, but again the results of the contest were inconclusive.

In the fourteenth century, Venetian wealth from its colonial empire increased greatly. The senate dominated commercial policy. The commune added a permanent presence in Constantinople and market privileges in the Crimea, Tana, and Trebizond in the Black Sea and, late in the century, on the island of Corfu. The independent Venetian fiefdoms in the Aegean depended more and more on the Rialto for protection from the threats of Turkish pirates.

Venice maintained a mercantilist policy toward its colonies. The commune siphoned all seaborne trade from the colonies on Venetian vessels to Venice and insisted that certain quantities of grain be shipped annually to Venice to feed the inhabitants. The Venetian commune monopolized the production of salt on the lagoons, Istria, and the

Adriatic coast and became the sole supplier for the northern Italian mainland. In the fourteenth century, Venetian ships brought salt from the Aegean to satisfy this demand.

During the fourteenth century, the governments of the Venetian colonies mirrored that of Venice itself. Each colonial executive was elected by the great council of Venice from the Venetian patriciate. He served for two years, together with other, lesser elected Venetian officials. Crete had its duke, Modon and Coron had their castellan, Alexandria had its consul, and Negroponte had its bailiff, as did Constantinople. Each elected colonial governor had the duty of enforcing civil and criminal law and justice, assisted by Venetian officials and by a council representing the resident colonists.

Competition from Genoese, Greek, and Turkish pirates at sea and from predatory land powers created unsafe conditions for Venetian commerce, although commerce became increasingly profitable in the fourteenth century, when it was bound by regulations enforced by Venetian civil servants. At mid-century, Venice experienced an economic crisis brought on by the black death and by the indecisive third war with Genoa (1350-1355), which was expensive in terms of both men and money. This was followed by a thirty-year truce between Venice and Genoa; but the truce in turn was followed by the decisive fourth war with Genoa (the war of Chioggia, 1378-1381). The fourth war began when the two republics clashed over Tenedos, guarding the Dardanelles, and also over the lucrative markets in the Black Sea. Venetian fleets under Carlo Zeno and Vettor Pisani fought against Genoese fleets throughout the Mediterranean, but Pisani was imprisoned by the commune because he had lost a battle with the Genoese at nearby Pola in Istria. The Genoese, assisted by their allies on the mainland, besieged Venice itself and took Chioggia at the southern edge of the lagoons. A Genoese fleet patrolled the Adriatic, cutting off the Rialto from its food supply. With famine threatening, the desperate commune released the popular Vettor Pisani from prison. He created a new fleet of small boats manned by enthusiastic Venetian craftsmen and shopkeepers, who maneuvered through the shallow lagoons to besiege the Genoese in Chioggia. At this critical moment, Carlo Zeno's fleet returned to the lagoons from successful raids against the Genoese. With Zeno's blockade by sea and Pisani's blockade on the lagoons, the

Genoese were forced to surrender. The resulting peace of Turin, mediated by Amadeus VI of Savoy (the "Green Count"), divided the points of colonial conflict between Genoa and Venice.

Next, Venice faced the growing threat of Turkish sea power, as the Ottomans gained more territory in Thrace and Thessaly to complement their control of the interior of Asia Minor. At the end of the fourteenth century, Tamerlane burned Tana on the Sea of Azov and temporarily destroyed all Venetian access to the northern silk route. Venetian commerce was to grow during the Renaissance in spite of these challenges.

Society and Culture

The people of Venice were bound together by their physical setting and the common need to protect themselves in an unfriendly environment. Not only the rivers but also the sea flooded them, and earthquakes shook them on their small islands at the upper reaches of a salt sea. Their position, however, was easily defensible. Only twice before 1400 did they come under enemy attack: in 811 from the Carolingians and in 1380 from the Genoese. Each time the Venetians emerged victorious.

Who was a Venetian? He or she had a Venetian father and lived on the lagoons. Persons who had a Venetian father in a Venetian colony were also recognized as Venetians. To be Venetian conferred distinct commercial advantages. Before 1204, Venetians could buy and sell in the Byzantine empire without paying the heavy Byzantine commercial dues. In the Latin empire of Constantinople, Venetians were guaranteed special privileges. During the fourteenth century, only Venetians could bid at auction to own and outfit a great galley in the annual convoys from Venice

The patricians of Venice directed the city throughout its history. A tradition from the Renaissance, recently questioned by historians, names twelve founding families, the "apostolic families," who continued to lead Venice for centuries. The earliest patricians of Venice were known as tribunes, local officials enforcing law and order under the exarchs of Ravenna. The early doges came from this class and were assisted by it. Some patrician families died out, and other families took

their place. The *Serrata* of 1297 separated the members of the great council from other Venetians, and yet that council accepted new families during the fourteenth century, particularly during the war of Chioggia. One must accept the fluidity of society in medieval Venice.

Feudalism did not exist in Venice. A society policed by men on horseback could not exist in the islands on the lagoons, where everyone moved by boat. Yet some trappings of feudal society were copied by Venetians in the twelfth and thirteenth centuries: feudal manners, and the enjoyment of jongleurs, romances, and jousts. Venetian landholding in the lagoons was never subject to enfeoffment. The limited land available was bought and sold, mortgaged and rented. By the tenth century, if not before, the major activity of Venetians would be trading down the Adriatic, across the sea to Byzantium and the Muslim world. This urban mercantile society differed sharply from the agrarian-based feudal society of mainland Italy.

The life of a Venetian patrician followed a regular pattern. In his youth, he learned the techniques of business from a master of the abacus. In his teens, he would accompany a mature merchant on trading voyages. Venetian merchant manuals, which have survived from the fourteenth century, demonstrate that the young merchant collected information on the "conversion of the bewildering variety of medieval weights, measures, and moneys and information on local conditions, on quality standards, and on common frauds." As an adult, he would travel frequently with partnership contracts for other merchants and would also participate in the government of the commune. Domenico Gradenigo made thirteen commercial voyages abroad between 1206 and 1224. In old age, the merchant usually remained at home, entrusting his investments to younger men. In extreme old age, the Venetian would retire to a monastery.

Venetian women seldom appeared in the medieval sources. Girls were educated in convents. Their fathers arranged their marriages and calculated the dowries, which included money and credits, household goods, and clothing. Some articles of apparel were passed down from generation to generation. Spiritual, ill-favored, or unlucky girls became nuns, and their fathers gave their dowries to the convents. The Benedictine convent of San Zaccaria, next to the ducal palace, played a significant role in politics because daughters of the most noble

patricians entered it. Widows sometimes operated on their own authority without the permission of a male relative. A widow's dowry and inheritance were hers to invest in local business, real estate, and the overseas trade, although male relatives often guided a woman's business. Medieval Venetians sometimes married foreign women: Doge Pietro IV Candiano (d. 796) married Waldrada, the sister of Marquis Ugo of Tuscany; Doge Otto Orseolo (d. 1032) married the sister of King Stephen of Hungary; Doge Pietro Ziani (d. 1229) married Costanza, the daughter of King Tancred of Sicily. Venetians living in overseas colonies often married local women. Gasmules, the sons of Venetian men and Greek women in the east, had special status in Venetian law.

Beginning in the fourteenth century, wealthy nonnoble Venetians who did not engage in mechanical trades were called *cittadini*. Native *cittadini* who were trained as lawyers and notaries could aspire to positions not open to patricians in the ducal chancery and the law courts. The most important position was grand chancellor to the doge. *Cittadini* and patricians enjoyed the same commercial privileges at home and in the colonies.

Venetian industrial production expanded in the thirteenth and fourteenth centuries, as foreign markets and immigration from the mainland created a greater demand. Craftsmen and shopkeepers produced and sold items for local consumption: woolen cloth, shoes, weapons, and household utensils. Carpenters and stonemasons built the palaces, bridges, and warehouses of the city. Shopkeepers sold wine, meat, vegetables, and other foodstuffs. Craftsmen built ships both in private shipyards and in the government-controlled arsenal. This arsenal, first mentioned in 1104, and enlarged in 1303 and 1325, produced and outfitted large ships for the commune.

Craftsmen and *cittadini* organized into confraternities (the *scuole* and the guilds) for religious observances and mutual aid. By 1300, the four larger nonprofessional confraternities were recognized as *scuole grandi*. Craftsmen also organized into craft guilds with charters approved by communal officials. By 1300, more than 100 craft guilds were known in Venice. However, in Venice—unlike Florence and nearby Padua—these craft guilds did not participate in the government of the commune but rather were regulated by it. Each guild elected its own *gastald*, chosen from the ranks but approved by the authorities. No guilds were formed

by the most numerous of the city's workforce, the seamen; or by the most influential businessmen, the international merchants. The rich merchants had no need to form guilds, because they controlled and staffed the commune's offices to benefit their own commercial interests. Since *cittadini*, craftsmen, and shopkeepers were encouraged to rise to prominence, each in his own niche, and since patrician authorities promoted peace and trade that benefited all, the city of Venice rarely experienced social upheavals after 1300.

Venice, like the rest of Europe, experienced great population growth in the 250 years before the black death of 1347–1349. Its population, estimated at 160,000, placed Venice among the largest cities of Europe just before the black death. But that sudden catastrophe killed perhaps three-fifths of the population of the lagoons within eighteen months. Afterward, the city began to recover. Immigrants came from the mainland when local harvests were poor, attracted by Venice's reputation for feeding its people with grain imported from overseas. Lombards, Tuscans (especially men of Lucca and Florence), Dalmatians, Germans, Hungarians, and Jews swelled the population. In the fourteenth century, citizenship was made available to foreign-born persons residing in Venice if they had lived in the city for twenty-five years and did not engage in the mechanical trades, or if they married Venetians. A few of these new wealthy citizens were granted membership in the patriciate at the critical time of the war of Chioggia.

Venetians joined together in support of their church. By the twelfth century, they were organized into seventy parishes. The Venetian church leaned toward Rome and accepted the Roman theology, liturgy, iconography, and system of church government. After the translation of the remains of Saint Mark the Evangelist to Venice in the ninth century, Mark became the spiritual father of the lagoons, a symbol of the unity of Venice. As England had Saint George and Rome had Saint Peter, so Venice had Saint Mark. The basilica of Saint Mark was the private chapel of the doge, where state ceremonies began. The *primicerio* of this palatine chapel was the leading ecclesiastic in Venice, politically more important than the patriarch of Grado, titular head of the Venetian ecclesiastical establishment. Under Enrico Dandolo (the uncle of Doge Enrico Dandolo), patriarch from c. 1135 to 1187, the patriarchal palace was permanently transferred from Grado, which was frequently

flooded, to the parish of San Silvestro near the Rialto. Patriarchs belonged to Venetian patrician families and often, but not always, supported the policies of the doges. Six bishops served under the patriarch of Venice. The bishop of Castello (earlier known as bishop of Olivolo) had jurisdiction over the Rialto but was himself subordinate to the patriarch. Until the late thirteenth century, all abbots, bishops, and other church dignitaries belonged to patrician families.

Monasteries on the lagoons perpetuated the rule of Saint Benedict and were under the authority of the local bishops. The monastery of San Giorgio Maggiore, on its own island, held first place among Venetian houses. It was founded in 982 by the entire population of Venice, headed by the doge, patriarch, and bishops. By 1300, the lagoons had sixty Benedictine houses.

Because the Venetian church and state were so closely intertwined, the papal reforms of the eleventh and twelfth centuries did not take hold on the lagoons; instead, local ecclesiastics carried through their own reforms. Cluny, Citeaux, and the Pre monstratensians established no more than a weak presence. The patriarch and local bishops led the fight in Venice against heresies; not until 1289 did an emaciated papal Inquisition appear there. The Venetian clergy were not hostile to the commune; they supported it. Writing to Pope Innocent III during the Fourth Crusade, a Venetian cleric said, "We Venetians always work for the honor of God and of the holy Roman Church." The ducal oaths of office supported the premise that God and the church joined in the Venetian state. The doge, *rex sacerdotus*, with powers from God, approved the election of church officials and invested them with their property.

In the thirteenth century, Venetian society welcomed the Franciscans and Dominicans. Doge Iacopo Tiepoio donated land to build the great Dominican church of Santi Giovanni e Paolo, where doges, admirals, and captains would be buried. The great Franciscan church, Santa Maria Gloriosa dei Frari, was built on land donated by the Badoer family. Venetian laymen welcomed the friars and willed bequests for them. Dominicans began to occupy the patriarchal and episcopal seats of Venice in the late thirteenth century; among these Dominicans was Tolomeo da Lucca, bishop of Torcello from 1318 to 1327, theologian, historian, and confessor of Saint Thomas Aquinas.

Venetian was the language most commonly spoken on the lagoons, but it appeared in written form only occasionally from the eleventh century on. It was not the language of culture, science, business, or government. Priest-notaries drafted documents in Latin for the church, private business, and government. Proximity to Bologna brought legal scholars to Venice, and patricians sent their sons to Bologna for legal training. The earliest written law codes, drafted in Latin before 1250, recorded the local customary criminal, maritime, and civil law. The civil law of Venice compiled for Doge Iacopo Tiepolo in 1242 continued to be the basic law of Venice until 1797. Venetian jurists added interpretations, drawn from opinions of Italian glossators such as Odofredus. Venetians also developed their own historical tradition; and most histories were written in Latin. When the Venetian Marin Sanudo Torsello (1270–1343) wished to propagandize for a new crusade, he wrote in Latin. The scholarly doge Andrea Dandolo (d. 1354) composed his chronicles in Latin.

Yet Venice, like other Italian cities and the Venetian colonies in the thirteenth century, accepted French as a literary language. The Venetian troubadour Bartolomeo Zorzi wrote in French, as did the engaging chronicler Martino da Canal. Marco Polo's *Relazioni*, taken down in a Genoese prison by a Pisan, appeared first in French.

With Dante, however, Venetians, like other Italians, began to accept Tuscan as a literary language. Petrarch lived in Venice for many years. The commune gave him a house on the Riva degli Schiavoni, and he offered to bequeath his library to the city. Although the library was dissipated, Petrarch's example and his friendship with Doge Andrea Dandolo and Andrea's grand chancellors Benintendi dei Ravagnani (d. 1365) and Rafaino Caresini (d. 1390) established humanistic ideals in the Venetian patriciate. Consequently, Venice assumed a unique identity among the cities of northern Italy, because the city joined its local traditions with influences from both the Latin west and the Greek east.

Venice: Art

The urban geography of Venice as we know it today dates from the twelfth century. Over the course of some four centuries the small, swampy islands of the Venetian archipelago had been gradually drawn

together through a Herculean process of land reclamation to which the early documents give eloquent testimony. The earliest known plan of Venice, of c. 1346—which is preserved in the *Cronaca magna* in the Biblioteca Nazionale Marciana—is based on a twelfth-century exemplar. It already presents a compact landmass, traversed by a broad S-shaped canal, that speaks of the formed city. Beginning in the thirteenth century, the formation of the city entered a new phase as the state began to play an increasingly larger and more directive role, ultimately assuming a substantial part of the financial burden in the impressive process of fusion that transformed the scattered islands into a functioning urban unit.

The major focus of Venice's first phase of urban development was the defining of a civic center. Shortly after the mid-twelfth century, in the 1160s or 1170s, on a site at the southern edge of the city that had previously contained a fortified enclave, a regularized civic center began to be constructed. It included residences for high-ranking administrators, an extended palace structure (*palatium communis*) that housed the doge's residence together with law courts and meeting rooms, and a grand new church of San Marco to shelter the relics of Venice's patron saint, Mark. Under Doge Sebastiano Ziani (r. 1172-1178), the land in front of San Marco was acquired for the state and established as a great open space with roughly the dimensions of Piazza San Marco as it stands today. In Venice, the term *piazza* is reserved for Piazza San Marco.

Two events can serve as anchor dates for the formative development of the civic center. On one side is the establishment, first recorded in 1152, of the *opus ecclesie sancti Marci*, the office of works of the new church of San Marco. This office, soon designated as the *procuratia di San Marco*, would eventually expand into a key administrative and financial bureau for the city as a whole. Marking the finalization of the conception of the civic core was the paving of the great open space that defined the civic center, Piazza San Marco, in the 1260s. In 1277, the state mint, the *zecca*, was moved to the civic center from the Rialto, thus concentrating the major government units at this central site. As a splendid urban scheme, the development of the Venetian civic center has been linked to the great imperial forums of ancient Rome and the antique forums and gathering places, still carrying the cachet of

imperial rule, that remained extant in medieval Constantinople.

The art of medieval Venice has its first phase in connection with the building and embellishment of the structure that dominates the civic core, the church of San Marco. The traditional starting date for work on San Marco as we see it today—the third church on the site—is 1063, under Doge Domenico Contarini (r. 1043-1071) and hence referred to as the "Contarini San Marco." According to a cherished Venetian tradition, San Marco was modeled on the church of the Holy Apostles in Constantinople; but in a pattern that was to stamp Venetian art for much of its history, San Marco represents a creative amalgam of western and eastern elements. The plan brings together aspects of the Roman basilica and the Greek-cross plan. Specific aspects of the construction—e.g., the type of the crypt and the character of the brickwork (thick bricks joined by thin layers of mortar)—separate San Marco from Byzantium and further connect it to the west. To be considered in conjunction with San Marco is the testimony to indigenous building provided by a group of churches on the nearby islands of Torcello and Murano. Having escaped later rebuilding campaigns, these structures bring one close to the early stages of church building in Venice. The church of Santi Maria e Donato on the island of Murano, substantially of the twelfth century, is basilican in plan with a superb hexagonal apse and handsome exterior brick patterning. The cathedral of Torcello, Santa Maria Assunta, founded in the seventh century and rebuilt in the eleventh and twelfth centuries, stands as a starkly impressive brick basilican structure. Also on Torcello is the small central-plan church of Santa Fosca, largely of the eleventh century with some twelfth-century additions, constructed on an octagonal plan and elegant in its exterior brickwork.

By the mid-twelfth century, work on the brick architectural shell of San Marco had reached a point where the interior was ready for the extensive deployment of mosaics that gives San Marco its distinctive identity among the churches of medieval Italy. The mosaic decoration of the domes and the interior vaults was carried out during the course of the twelfth century and the early thirteenth century. While clearly inspired by the mosaicencrusted interiors of Byzantine churches, the mosaics of San Marco, like the plan, bring together eastern and western elements. Following Byzantine precedent, the scheme is a Christ

centered cycle, but there are numerous deviations from Byzantine formulas that speak to traditions of Italy and France. Dominating the scheme are the three large domes set on an east-west axis. These present a succession of monumental Christological statements: the *Ascension of Christ* in the center dome; a *Pentecost* in the west dome that includes an exotic depiction of the *Nations of the World*; and *Christ as Emmanuel* (with the original composition intact but heavily restored) in the east dome. Narratives of Christ's life, the lives of apostles, and the lives of Venice's most honored saints are placed on the side walls and in the two auxiliary domes. The outer architectural unit or narthex running along the west and north flanks of the church carries an Old Testament cycle executed in the thirteenth century, generally thought to be based on early Christian manuscript models. It has been suggested that the inclusion of an Old Testament cycle may represent a response—and challenge—to the early Christian decoration programs of basilicas in Rome.

The mosaic workers of San Marco were famous and in demand in Italy during the thirteenth and fourteenth centuries. Pope Honorius III, in a letter of 1218 to the doge of Venice, Pietro Ziani, refers to a Venetian mosaic master sent to work in the church of San Paolo in Rome and requests two additional workmen. In 1302, the Arte di Calimala of Florence, the guild in charge of the fabric of the city's Baptistry, planned a search to locate skilled Venetian mosaic workers for the decoration program then underway. The San Marco mosaic workshops, under the supervision of the *procuratia di San Marco*, were strictly regulated. Preserved is an order of 1258 issued by the *procuratia* that spells out in detail the apprenticeship system within the workshops.

A new level of economic prosperity, and hence a new phase of urban development, accompanied the dramatic change in Venice's fortunes that took place at the beginning of the thirteenth century. The Fourth Crusade of 1201-1204, an enterprise in which the Venetians played a crucial role and which culminated in the Latin conquest of Constantinople, decisively changed the artistic stance of medieval Venice. New attention was directed to the exterior of San Marco, transforming it into a glittering urban showpiece. The exterior was sheathed in marble from the east, most notably the bluish-white

proconnesian marble, used in both straight-cut and dramatic zigzag patterning. In addition to prized marble, a large number of sculptures, reliquaries, and other religious objects were brought from the east. Among the more renowned pieces transported from Byzantium in the wake of the Fourth Crusade are the porphyry group of the tetrarchs, the porphyry head of a Byzantine emperor (the so-called *Carnagnola*) on the balustrade of the upper story, and, most spectacularly, the four gleaming bronze horses of San Marco, set high on the west facade, resonating with overtones of Roman imperial triumph and the triumphal spread of Christianity.

Jacopo de' Barbari, map of Venice of 1500, detail of civic center. Rosenwald Collection, Board of Trustees, National Gallery of Art, Washington, D.C.,

The thirteenth-century embellishment of the exterior of San Marco included an extensive sculptural program, carried out largely from 1220 to 1260. The work consists of two principal components: the archivolt framing the three main doorways of the west facade, and the reliefs set into the facade and flanks of the church. A significant number of these reliefs also represent Byzantine spoils, although scholars are still sorting out which are Byzantine and which come from the workshops of San Marco. The highly original archivolt sculptures, featuring personifications of virtues, the months, and the trades of Venice, reveal the strong influence of sculptors working in other parts of northern

Italy, in particular the classicizing sculptor Benedetto Antelami. The upper face of the west facade was inset with an important series of figural reliefs. These include a figure of the orant Virgin, possibly of Venetian manufacture; and two much-discussed reliefs of Hercules, one (*Hercules and the Boar*) of late antique production and the other (*Hercules with the Hind and Hydra*) attributed to a thirteenth-century Venetian sculptor known as the Hercules Master.

In the second half of the thirteenth century, the urban development of Venice spread out from the civic core. Indicative of the intensified attention to the development of the city as a whole are the regulations of 1269–1272 regarding construction along the principal thoroughfare leading from San Marco to the Rialto and the paving of this thoroughfare in brick. In 1282, a new public office, the *Piovego*, was created, with vast responsibilities for overseeing growth and development within the city as a whole.

The oldest palaces, extensively altered in later periods, have their first stages in the urban consciousness of the second half of the thirteenth century. In the thirteenth century, a distinctive Venetian palace type was already established, with storage rooms and access to the water on the lower level and living quarters above. A long passageway, the *androne*, cut through the entire depth of the building on the ground at water level; the great center hall—the *salone* or *portego*—was placed above it. The earliest Venetian palaces were two stories high, extended to three and four stories in later periods, with facade decorations focused on the windows of the second story. The Ca da Mosto on the Grand Canal near the Rialto, although also enlarged, remains one of the more vivid reminders of the early thirteenth-century phase of palace building in Venice. The structure known as the Fondaco dei Turchi (it was leased by the Venetian government to the Ottoman merchants in 1621 and is now the natural history museum of Venice) presents a larger and grander example of a thirteenth-century Venetian palace, complete with corner towers flanking two stories of elegant elongated Byzantine arches. The tower units were much amplified during the late nineteenth century, in a generally disastrous and misleading restoration, and almost everything behind the facade is of later construction. The Ca Farsetti and the Palazzo Loredan, both at the Rialto, are also notable for preserving a thirteenth-century core. A

series of fourteenth- and fifteenth-century palaces that carry the distinctive stamp of Gothic Venice replicate the thirteenth-century palace type, with successively more elaborate facade treatments but maintaining the basic plan and organization.

Paolo Veneziano, *Coronation of the Virgin*, dated 1358. Copyright The Frick Collection, New York.

During the fourteenth century, Venice experienced a building boom that included the newly built, greatly enlarged mendicant

establishments of Santi Giovanni e Paolo for the Dominicans (begun 1333), and Santa Maria Gloriosa dei Frari for the Franciscans (begun 1340). The new churches were accompanied by important open spaces known as *campi*. The model presented by Santi Giovanni e Paolo and the Frari was taken up by numerous fifteenth-century Venetian churches. Among those that work variations on the fourteenth-century mendicant type are San Giovanni in Bragora, San Giobbe, and Santo Stefano.

Venezia, relief rondel from west facade, Palazzo Ducale, attributed to Filippo Calendario. Reproduced by permission of Osvaldo Böhm, Venice.

The restoration and substantial rebuilding of the Palazzo Ducale was the most significant building project of fourteenth-century Venice,

involving a shift in artistic focus within the civic core from the state church to the seat of government. The late thirteenth-century reorganization of the Venetian government known as the *serrata del maggior consiglio*—the "closing" of the great council—had, in fact, resulted in a vast increase in the membership of that key governmental body. In 1340, plans were made for an expansion of the palace that would include a grand new meeting hall to accommodate the new membership. This vast room, with a capacity of 3,000 people, became one of the great meeting halls of Christendom, serving as a model for legislative chambers in Italy and elsewhere. The work of decorating the new room extended over most of the second half of the fourteenth century. The decorative scheme had three separate pictorial components, all to some degree replicated in the late sixteenth- or seventeenth-century campaign that created the room as we see it today. At the top of the walls, directly below the cornice line, was a sequence of ducal portraits *en buste*, each doge carrying a banner inscribed with a brief phrase heralding an important achievement of his *dogado*. A cycle of large narrative paintings on three sides of the room—among the earliest monumental secular narrative cycles of the post-antique period—depicted events of twelfth-century Venetian history. On the wall in back of the dais where the doge presided with his counselors, there was a huge fresco of the *Heavenly Jerusalem*, known as the *Paradise* (dated by inscription to the dogate of Doge Marco Cornaro, 1365–1368), dominated by a depiction of the *Coronation of the Virgin*. Fragments rescued from the fire of 1577 are on display in the Palazzo Ducale. Guariento di Arpo, a painter whose style had a strong Tuscan, Giottoesque component, was called in from Padua to paint the *Paradise* and several of the historical scenes of the side walls. Work on the room may have been largely complete by 1382, when the Palazzo Ducale came under the jurisdiction of the *procuratia di San Marco*. The first meeting in the new room is recorded in 1419.

San Marco also had its fourteenth-century phase, above all in the program of intensified ducal emphasis carried out under one of the most intriguing figures of late medieval Venice, Doge Andrea Dandolo (1343–1354). The chapel of Saint Isidore (1354–1355) was built onto the left transept arm to house the relics of Isidore, a Byzantine warrior saint; it has an extensive mosaic cycle in a lively narrative style. The

baptistery was given a complementary mosaic decoration focused on Christ and John the Baptist and including a *Crucifixion* in which Dandolo is shown at the foot of the cross. Dandolo was also responsible for the sumptuous reinstallation of the Pala d'Oro, a project dated by inscription to 1345, on the high altar of San Marco. This "golden altarpiece" is believed to have served earlier in San Marco as an altar frontal and to have been constructed at least in part of enamels imported from Constantinople. It was reorganized and partially remade in the fourteenth-century installation, set with hundreds of gems and given a gold filigree outer frame. Dandolo's role in the remounting is recorded in the inscription, together with a brief recounting of the earlier history of the *pala*.

The fourteenth century saw the emergence of Venice's first artistic personalities identifiable by name. The most important sculptor and architect of fourteenth-century Venice was Filippo Calendario (c. 1315–1355). Calendario played a major role in both the architecture and the sculptural program of the Palazzo Ducale. He was very likely the director of the workshop that initiated the superb series of capitals of the ground-floor loggia of the Palazzo Ducale, one of which bears the date 1344. These capitals present an elaborate encyclopedic program that includes representations of the classes of society, the trades and peoples of Venice, aspects of daily life, historical personalities from antiquity, and personifications of wisdom and justice—emerging out of luscious leafage, the *foglie grasse* of Venetian Gothic architecture.

The second major artistic figure of fourteenth-century Venice is the painter Paolo Veneziano (fl. 1333–1358). It has been argued that Paolo Veneziano had the status of official painter to the republic of Venice. His state projects included the commission of a wooden painted cover, dated by inscription to 1345, for the Pala d'Oro, with a sequence of the life of Saint Mark. He also worked on one of the important ducal tombs of the fourteenth century, the tomb of Doge Francesco Dandolo (d. 1339) in the chapterhouse of Santa Maria Gloriosa dei Frari. Panel painting came relatively late to Venice, and it is with Paolo Veneziano that the altarpiece became firmly established within the Venetian artistic tradition. He appears to have been the initiator of the typically Venetian altarpiece with elaborate architectural enframing, bristling with cornices, spires, and sculptural accents. To be numbered among

the masterpieces of his career are two altarpieces of the coronation of the Virgin, a subject that had considerable currency in Venice during the fourteenth and fifteenth centuries. One of these, dating from the 1430s, is a large polyptych painted for the Franciscan nunnery of Santa Chiara (now in the Accademia in Venice). The second, from his last period and showing him at the height of his powers, is the *Coronation of the Virgin* panel now in the Frick Collection in New York; it is signed with an inscription naming both Paolo and his son Giovanni, and bearing the date 1358. Paolo Veneziano was head of a family workshop that included a number of his sons, a type of workshop that was to become the norm in the artistic life of Venice for sculptors as well as painters.

The artistic qualities promoted by Paolo Veneziano—richly patterned fabrics and an enamel-like vividness of color—decisively stamped Venetian painting until the end of the fourteenth century. To be singled out for special attention in the second half of the fourteenth century is Lorenzo Veneziano (fl. 1356-1372), who played a directive role analogous to that of Paolo Veneziano in the first half of the century. Lorenzo's earliest signed surviving work is a polyptych of 1359 from the church of Sant'Antonio in Venice featuring at its center an Annunciation (Accademia, Venice) with an elaborate inscription giving the names of the carver of the frame, the founder of the church, and the commissioner of the work, the patrician Domenico Lion. Lorenzo Veneziano preserved a great deal of the aesthetic of Paolo Veneziano; particularly striking is his adherence to the attenuated Byzantine figure of the saint. However, Lorenzo also incorporated new currents into his work. His figures interact with a new vivacity, and there is a turn toward the heavier, more physically present figure favored on the mainland. His altarpieces introduced a number of new themes into the Venetian tradition. The large-scale Annunciation figures prominently in his work, often as the central panel of a polyptych, and his *Delivery of the Keys to Saint Peter* (Museo Correr, Venice) presents a heavy, forceful seated figure that would influence later Venetian altarpieces of enthroned saints. Although the full account of late fourteenth-century Venetian painting still needs to be worked out, a few interesting personalities hold out promise for future work. Among these is the evocative and mysterious Jacobello Alberengo (d. before 1397), known

from a series of Apocalypse panels (in the Accademia) from the demolished church of San Giovanni Evangelista on Torcello.

Medieval Venice should also be understood as rich in sculptural accents of a wide-ranging variety. The public squares (*campi*) as well as private interior courtyards had handsome wellheads, large numbers of which are still to be seen in the city although they no longer serve a practical function. Miscellaneous pieces, often of Byzantine or presumed Byzantine manufacture, mark the outside walls of private dwellings. Buildings and *calli*—the narrow Venetian streets—are marked by emblems of confraternities and family arms. Notable are the carefully constructed sculptural statements that serve as encapsulations of Venice. The Lion of Saint Mark, placed during the thirteenth century on a column marking the entrance to the civic center from the sea, is a composite piece made to serve as an emblem of Venice's patron saint and of the city itself. A relief personification of Venice, enthroned and crowned like the Virgin, ruling with wisdom from Solomon's lion throne, was placed on the west facade of the Palazzo Ducale as part of the fourteenth-century rebuilding campaign; Wolters (1976, 1994) attributes this relief to Filippo Calendario. Tomb sculpture is another significant aspect of the art of medieval Venice. The ducal tomb became part of the public display of Venice around the mid-thirteenth century when the tomb of Doge Jacopo Tiepolo (r. 1229-1249) was placed outside the entrance to Santi Giovanni e Paolo. Notable fourteenth-century tombs are those of Doge Giovanni Soranzo (r. 1312-1328) in the baptistery of San Marco, the first tomb of a ruler in the west to be erected in a baptistery; Doge Francesco Dandolo (r. 1329-1339) at the Frari, the first tomb of a ruler in a mendicant chapterhouse; and Doge Michele Morosini (1382) in the choir of Santi Giovanni e Paolo—a densely sculptural tomb with an elaborate architectural fresco surround, one of the outstanding tombs of medieval Italy in its wall-filling ambitions.

Appropriately, what can be considered the last major artistic project of late medieval Venice and the culmination of its sculptural style—a work from the end of the fourteenth century—was commissioned for San Marco. This is the superb ensemble of grieving apostles and the Virgin by Jacobello dalle Masegne (fl. 1383—c. 1409) and his brother Pierpaolo dalle Masegne (fl. 1383-c. 1403) that crowns the iconostasis

closing off the Cappella Maggiore of San Marco. The architrave carries an inscription dating the work to 1394 and names the government officials—Doge Antonio Venier (r. 1382-1400) and the two procurators of San Marco—under whom the work was carried out, as well as the two sculptors. The work is not a true iconostasis in the Byzantine sense—that is, a carrier of icons—but rather a typically Venetian melding that brings together the eastern concept of iconostasis, the French idea of choir screen, and the Italian idea of dramatic display of individual sculptured figures. Stylistically, the figures of the iconostasis draw heavily on mainland developments—a link with Andrea Pisano and his followers is to be particularly noted—but the austerity and severity of many of these figures suggest that the artists looked closely at Byzantine pieces.

Venosa

Venosa is a city in Basilicata, about 6 miles (10 kilometers) east of Melfi. It was important under the Romans and was a bishopric in the sixth century, but it was destroyed by the Lombards (and probably lost its bishopric, which, however was functioning again by 817). The Arabs took it in 842; however, Emperor Louis II recovered it c. 868. It became part of the Lombard duchy of Salerno but was then seized by the

Normans in 1041. Drogo de Hauteville became its lord and revived the building of the abbey of the Santissima Trinita that had been begun in 942 by Gisulph of Salerno and abandoned. From Drogo (who was assassinated there in 1051) Venosa passed in turn to his brothers Humphrey and Robert Guiscard. Their tombs are in the abbey. Venosa was the center of two major rebellions (in 1127 and 1128) and an unsuccessful invasion by Emperor Lothair III (1134). It prospered under Frederick II and supported both Manfred and Conradin against Charles of Anjou, who severely punished it after the battle of Tagliacozzo. Later, Charles established a hospital for injured veterans there. Under Joanna I, Venosa declared for the Hungarians in 1350; when it was recovered, Joanna granted it to the Sanseverino. After Melfi, Venosa was the largest town in Angevin Basilicata. Its main products were wheat, barley, and wine.

A huge enlargement of the abbey was begun in 1063 under Robert Guiscard: a cruciform apsidal church was planned, incorporating the old church in the nave, the architecture modeled on French Cluniac churches; but only the walls together with pilasters, piers, and columns, all with Romanesque carved capitals, were built. The enterprise was finally abandoned when Pope Boniface VIII transferred the abbey from the Benedictines to the Hospitallers in 1297.

Verdun, Treaty of

The treaty of Verdun (843) spelled out an agreement among the three sons of Louis I the Pious partitioning the unified empire that Louis had sought to create into an independent kingdom for each son. Louis received all territories lying east of the Rhine, creating a kingdom of the East Franks. Charles received as his kingdom of the West Franks the territories west of a line marked by the Meuse, Scheldt, Saône, and Rhone rivers. To Lothair (Lothar) went the "middle kingdom," comprising the territories between the kingdoms of Louis and Charles from the North Sea to the Alps as well as Italy. Lothair was recognized as emperor, but that title implied no effective authority over his brothers.

The site on the Adige River that we now call Verona was inhabited as early as the Neolithic era. Its identity as a city developed in 49 B.C., when it was recognized as a Roman *municipium*. The arch of the Gavi, a theater, and an imposing arena still survive to recall its prosperity under imperial rule. Roads and rivers made it a very hospitable place.

Verona is nestled in a crook of the Adige just as the river begins to meander southward across the plain and thus was on the edge of two very different worlds. To the north rise the foothills of the Alps; to the south stretches the broad expanse of the Po River valley. Three major Roman thoroughfares passed through the city. The Via Claudia Augusta took travelers south to Rome or north through the Alps to Augusta Vindelicorum (Augsburg). The Via Postumia traversed the entire Po valley beginning in Aquileia, turning southwest at Verona, and continuing to Genoa. The Via Gallica carried traffic westward to Brescia. These roads remained major arteries through the Middle Ages.

The Adige's serpentine embrace made the site of Verona easily defensible: the river bounded three sides, and then walls closed off the southern flank. In Roman times, the walls were pierced by only two gates and enclosed roughly a third of a square mile (about eight- or nine-tenths of a square kilometer). During the Middle Ages, the city expanded both northward and southward. The Lombards created a fortified center (*castrum*) across the Adige on the slope of Colle San Pietro, and in the twelfth century the commune extended these fortifications to the southeast. At the same time, it enclosed the suburb under the Roman walls by building a new set of walls a third of a mile (about 0.5 kilometer) further south. Under the rule of the Visconti in the late fourteenth century, Verona's walls were expanded again, more than doubling the fortified area.

The grid of the old Roman street plan is still evident in the city center. The Roman forum (today Piazza delle Erbe) remained the market of the medieval city and its center of public authority. The royal and ducal residences of the early Middle Ages were nearby; the commune built its palace on the edge of the *piazza* in the twelfth century; and the Scaliger (Delia Scala) *signori* erected their palaces alongside. To the northwest, in the curve of the Adige, was Verona's medieval ecclesiastical center, with the cathedral, the bishop's residence, and the canons' library and cloister. The city's most venerable

monastery, San Zeno, was located outside the Roman and communal walls just off the Via Gallica. In it was buried the city's patron, Saint Zeno, the fourth-century bishop who converted the Veronese.

Political History

During the fifth century, as various invaders, such as Odovacar (Odoacer) and the Ostrogoth Theodoric, assumed the frayed mantle of imperial rule in Italy, Verona took on greater importance as a military and political center. Theodoric's decisive defeat of Odovacar occurred just east of the city (at San Martino Buonalbergo), and Theodoric had a palace built for himself on Colle San Pietro overlooking Verona. During the Gothic wars, the city fell to the Byzantine general Narses c. 556, but this restoration of imperial rule lasted only twelve years. In 568, the Lombards established their kingdom in northern Italy, and Verona became one of their two capitals (Pavia was the other). The choice of Verona turned out tragically for the conqueror Alboino, who was assassinated in the palace on Colle San Pietro in 572, but his successors fared better in the city. Under kings Desiderius and Liutprand in the eighth century, the Lombards abandoned Arian for Catholic Christianity, and the bishops of Verona transferred their see within the walls to the site of the present cathedral.

The cathedral clergy, in particular, flourished after the Carolingian conquest in 774. Bishop Ratoldus organized and endowed the chapter (or *schola*) in 813, and its famous library, which is still serving scholars today, seems to have originated around this time. The manuscripts preserved in the library suggest that Verona participated actively in the Carolingian renaissance. This is also suggested by the accomplishments of its bishops: Egino (780-803) designed Saint Peter's basilica in Reichnau before coming to Verona; the theologian Nottingus (840-844) corresponded with Hincmar of Reims and Rabanus Maurus; and Adelard (876-915) was a poet.

Although Charlemagne was in Verona at least once in 787, Carolingian rule was normally exercised in the city through a count. Verona did not become a royal residence again until the Italian kingdom faced a crisis when Louis II died in 875 without an heir. Of the

many claimants to the throne, Berengar I of Friuli (888—924) managed to eliminate all his rivals by 905 and assert uncontested authority; he made Verona his capital and the city's bishop his archchancellor. The city remained important in the politics of the kingdom under Hugh of Aries (r. 926-947), Lothar II (Lothair, r. 931-950), and Berengar II of Ivrea (r. 950-962), but during this period of its history its bishop, Ratherius, was a more potent force.

Church of San Zeno, Verona. Photograph courtesy of Christopher Kleinhenz.

Ratherius, a monk of Liège, was bishop of Verona in 931 — 934, 946-948, and 961-968. Imperial politics, and the importance of bishops in these politics, can account for his first exile in 934 (Ratherius had wavered in his allegiance to Hugh during Arnulf of Bavaria's bid for the kingdom), Ratherius's own fierce religiosity, caustic wit, and strong will contributed to his other expulsions from the see. A vivid, if somewhat unflattering, view of the Veronese church and society emerge from the bishop's letters, his sermons, and his *Praeloquia*, a discourse on human roles and duties. Although Verona was certainly not unique in suffering from political corruption, ecclesiastical disorder, and pervasive greed, it was unique in having an articulate observer to chronicle all this. Ratherius of Verona was one of the few literary luminaries Europe produced in the tenth century.

With the establishment of Ottonian rule in northern Italy in 961,

Verona's location at the base of the Brenner Pass made it a fulcrum of imperial rule. For the rest of the Middle Ages, the city made the most of this strategic position; it remained loyal to the imperial party but repeatedly negotiated privileges and rights in return for its allegiance. Emperors and their armies spent considerable time in the city, particularly the embattled Henry IV, whose retreat over the Brenner Pass was blocked by southern German opponents in the 1090s. San Zeno, just outside the city walls, became an imperial center; a significant palace complex emerged here in the twelfth century.

Within the walls, an alliance of merchants, lesser knights, and the bishop gave birth to an independent communal government in the early twelfth century. An accord on trading privileges between leading Veronese citizens and Venice in 1107 is the first evidence of independent governance, although consuls do not appear until 1135. By the mid-twelfth century, the commune had established its sway over the *contado* (countryside), and it gained grudging if practical recognition from the empire in 1156, after Frederick I Barbarossa came to realize how perilous the mountainous roads north of Verona could be without the city's friendship. Like other cities of the Marches and Lombardy, however, Verona participated in the leagues arrayed against Frederick's attempted reimposition of direct imperial rule and won the full juridical recognition set out in the peace of Constance (1183). This communal government ruled Verona until the advent of the Scaliger lordship in 1277.

Like that of most Italian communes, Verona's government was led alternately by consuls or rectors and *podestà* (podestas, city magistrates) throughout the late twelfth century. Factional infighting between the aristocratic Conti party (whose main constituent was an old comital family, the Sambonifacio) and its more popular opposition (the Monticoli, a leading mercantile family, and their supporters) brought the city under the domination of the tyrant Ezzelino da Romano in 1225. Under his leadership, Verona briefly adhered to the second Lombard League against Frederick II in 1226, but it was reconciled with the emperor the following year. Ezzelino's vicious rule, however, exhausted the city, and fear of new factional violence after his death in 1259 resulted in the domination of native *signori*, the Delia Scala (Scaliger).

Under the Delia Scala, Verona became the center of a significant territorial lordship encompassing, at its height in the 1330s, most of the Veneto and parts of Emilia and Tuscany. In 1387, the city exchanged its native *signore* for a foreign one when it fell to Gian Galeazzo Visconti and was incorporated into the Milanese territorial state. As *dominus generalis et perpetuus*, Gian Galeazzo ruled the city, through local functionaries, until his death in 1402. Like the Scaliger lords, he maintained the outer forms of the communal government, but he "reformed" its statutes to suppress all independent local political activity. Financial exactions led the Veronese to revolt on 22–24 June 1390, but a prompt and thorough sack of the city by Visconti troops restored Milanese control.

Gian Galeazzo's death led to a brief attempt to restore the Delia Scala. With the help of the Da Carrara family of Padua, Guglielmo Delia Scala returned to the city in 1404. The local allies of the Visconti (the Dal Verme, aided by the Gonzaga of Mantua) appealed to both Venice and Filippo Maria Visconti to oppose the Scaliger faction. As Filippo Maria was planning to reconquer the city, the Venetians won over the Gonzaga with promises of several key castles, and the *popolo* rose against the Da Carrara and sought an accord with Venice. On 23 June 1405, Verona came under Venetian rule, which was to last until the Napoleonic conquests.

Social and Economic Life

In the Roman era, Verona produced several important agricultural commodities: spelt, wood, and wine. The area still excels in viticulture: Valpolicella, Bardolino, and Soave are all notable wine-producing communities in the rolling hills north of the city. Flax seems also to have been grown, and *lintiones* (linen workers) appear in early sources.

In the Middle Ages, the production of cloth (wool, cotton, and linen) continued to be a significant part of the local economy. Verona's prosperity, however, depended on no single industry. Its economy was diverse, with strong artisanal activity (wood, leather, and metalworking) and trade in agricultural products, manufactured goods, and raw materials. As early as the mid-tenth century, commerce was

pervasive enough to draw ecclesiastical censure: Bishop Ratherius once barred the gates of the city in a dispute with townspeople over trading on Sundays. From the eleventh century on, Veronese merchants were active all along the major trade artery linking Venice, and the goods of the Mediterranean world, to Germany and northern Europe.

Through the twelfth century, the bishop held rights over the city's central market at the old Roman forum (Piazza delle Erbe) and collected tolls and dues at the city's gates and on river traffic along the Adige. However, through leasing arrangements with laypeople to facilitate the collection of these dues, and through a progressive diminution of episcopal power in the communal era, jurisdiction over trade came under secular authority. In the early thirteenth century, a council of merchants emerged as a separate deliberative body in the government, distinct from the council of the commune. In 1209, this *domus mercatorum* had its own *podestà* and consuls and was exercising jurisdiction over the guilds and military control over the major arteries of commerce (roads and the Adige). By the advent of the Delia Scala *signoria*, it was the most influential body within the commune.

Commerce was so pervasive that by the twelfth and thirteenth centuries there was little distinction between a feudal and a mercantile nobility. Even branches of the comital Sambonifacio family were sufficiently involved in commerce to serve as officials in the *domus mercatorum*, and elite knightly families—such as the Visconti, Avvocati, and Turriseudi—collected tolls and market fees. Urban families that came to prominence through mercantile activities, such as the Crescenzi and the Monticoli, tended to become vassals of leading ecclesiastical institutions and through these ties acquired lands and castles in the countryside. The enmity between Verona's two factions, or *partes*—the Conti and the Monticoli (later the *pars quattrovigenti*)—was based on political competition rather than social distance. The mercantile Crescenzi, for example, supported the Conti; and the Turriseudi family, counts of Garda in the twelfth century, supported the Monticoli.

The expansion of settlement in the Veronese countryside during the eleventh century—evident in new place-names and mentions of land clearance—indicates a growing population. In the twelfth century, this rural expansion continued with swamp drainage projects sponsored by

the commune. The urban population was also expanding. The population of Verona was probably at least 10,000 in the eleventh century and approximately 20,000-25,000 in the thirteenth; it reached its maximum for the medieval period—35,000-40,000—just before the black death. When records again allow us to gauge the population, in the early fifteenth century, it was only 14,800, but a rapid recovery in the second half of the century brought it back up to 42,000.

Art and Architecture

Early medieval churches were built of wood in most parts of Italy, but several examples of early stone churches survive in Verona. The church of Sante Teutera e Tosca was built in the late ninth century, as was the rural parish of San Zeno in Bardolino with its beautiful Carolingian capitals. The crypt of San Procolo also dates from before 1000, as do parts of Santo Stefano. San Giorgio in Valpolicella has an ornately sculptured and inscribed *ciborium* from the early eighth century; and the monastery of Santi Nazaro e Celso preserves a cycle of tenth-century frescos. Another highly significant remnant of medieval Verona is an eighth-century altar cloth known as the Velo di Classe (now in the Museo Nazionale at Ravenna), embroidered with images of twelve early Veronese bishops.

Verona is best-known, however, for its Romanesque art and architecture. Its political and economic ties made the city a fertile meeting ground for Mediterranean and ultramontane influences. Its early rural Romanesque churches—San Severo in Bardolino, Sant'Andrea in Sommacampagna, San Pietro di Legnago, San Giorgio di Valpolicella—blend Carolingian plans with the rhythmic decoration and rounded masonry forms of the *magistri comacini*. More refined and complex examples are also found in the city. San Fermo Maggiore (begun c. 1065) is a double basilica, in which the lower church better preserves the Romanesque aesthetic (the upper church was renovated in the late thirteenth century, incorporating Gothic elements). San Lorenzo (c. 1110) has two round towers at its facade and a rhythmic alternation of slender columns and substantial piers down the nave. Good later examples of Romanesque architecture are Santi Apostoli,

Santissima Trinità, San Giovanni in Valle, and the baptistery, San Giovanni in Fonte.

The city's finest Romanesque church is San Zeno Maggiore. A monastery and church are documented on the site from the eighth century, although the community was certainly much older. The earliest elements in the present church date from the early eleventh century, but the structure assumed its characteristic form c. 1123-1135. San Zeno is a wooden-roof basilica with three naves, a small clerestory, and somewhat irregular bays (a result of delays in construction). A high choir, its parapet edged with sculptures of the apostles, sits above the crypt enclosing the patron saint, and ornately sculptured Romanesque arches frame the entrance to the crypt. The apse and the trefoil ceiling are Gothic. Alternating bands of white *tuffo* and red brick ornament the exterior. The facade, following the basilican profile, is dominated by a Romanesque porch (*protiro*) and an immense rose window (dating from the late twelfth century) encircled by a wheel of fortune. Flanking the porch are marble relief sculptures: those on the right, depicting scenes from the Old Testament, were signed by the sculptor Niccolò; and the series on the left, presenting scenes from the life of Jesus, were the work of Guglielmo. Sculptured scenes depicting the months of the year grace the architrave. The lunette contains a relief representing San Zeno and the forces of the commune; the saint offers his blessing and *vexillum* (standard) to the knights and foot soldiers of the city.

San Zeno's bronze doors, however, are its most notable ornament. Affixed to the wooden doors are forty-eight bronze panels, *formelli* (two missing panels are in Berlin), which are evidently the work of at least two artists from two distinct periods. The oldest group of *formelli* dates to the very late eleventh century or the early twelfth century. Toward the close of the twelfth century or the beginning of the thirteenth century, the doors were enlarged and other panels were added. These additional bronze relief sculptures, especially those depicting the life of San Zeno, are much more naturalistic in design than the earlier *formelli*, which have a delightful cartoon-like simplicity. Most of the earlier panels depict scenes from the New Testament, whereas the later panels added Old Testament scenes and episodes from the patron's life.

The city's cathedral, or *duomo*, Santa Maria Maggiore, was also

rebuilt in the first half of the twelfth century, and it too has an impressive Romanesque *protiro*. The sculptures here are also the work of Niccolò (c. 1135-1339). The rhythmic arches of the portal incorporate figures of prophets; the outer face of the portal has two *paladini*, usually identified as Roland and Oliver. An image of the Madonna enthroned dominates the lunette, flanked by the angel announcing the savior's birth to the shepherds and the wise men offering their gifts. The columns supporting the *protiro* rest on sculptured griffins.

Like San Zeno, the cathedral is a basilica without transept, culminating in a single apse. This plan, and its bichromatic (*tufo* and brick) exterior, place the *duomo* firmly within a well-articulated local architectural tradition. Its frieze ornamentation is particularly striking: it combines a rounded and fluid acanthus pattern embracing expressive animal figures with more sedately classical dentillated moldings and Corinthian capitals. The roof was raised, Gothic vaulting was added, and new columns were installed in the fifteenth century. Elements of Gothic architecture are also evident in the city's two mendicant churches, Sant' Anastasia and San Fermo.

However, the quality of painting in late medieval Verona far exceeds that of architecture. In the late fourteenth century, the Veronese artist Altichiero worked in the Delia Scala *palazzo* and completed an impressive fresco cycle (c. 1380) in the Cavalli chapel in Sant'Anastasia. In the early fifteenth century, Pisanello undertook several projects in the city. The most noteworthy is a fresco of Saint George and the princess in Sant'Anastasia. Mantegna produced the beautiful triptych of the Madonna with saints and cherubs above the high altar in San Zeno c. 1459.

The best local artists of the *Quattrocento* actually did most of their work for the Gonzaga dukes of nearby Mantua. Francesco Bonsignori, who was strongly influenced by Mantegna, worked in the Palazzo Ducale. A painting of the Madonna and child is preserved in the museum at Castelvechio in Verona, and a series of paintings in the Banda chapel in San Bernardino. Like Bonsignori, the Veronese Domenico Morone worked in the Mantuan Palazzo Ducale, but more of his work survives in Verona. Morone decorated the cupola in Santa Maria in Organo, the Medici chapel and the Sagramoso library at San Bernardino, and the cupola of the San Biagio chapel in San Nazaro.

Veronica, Veil of

The "veil of Veronica," in the best-known versions of this celebrated legend, is a cloth offered by a woman of Jerusalem to Christ as he was carrying his cross up toward Calvary and crucifixion. When he returned the cloth to her after wiping away the blood and sweat from his face, an image of his features was miraculously imprinted on it.

Veronica and the veil. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 97r.

An object alleged to be the relic, venerated at Rome since about the eighth century, was solemnly installed in Saint Peter's on the orders of Pope Boniface VIII in 1297, and popular devotion to it—despite the claims of similar, rival cloths in Milan and Spain—became intense and widespread during the later Middle Ages. Dante refers to *la Veronica nostra* ("our Veronica") in his famous passage about a pilgrim coming *forse da Croazia* ("perhaps from Croatia") to gaze at the relic in wonderment (*Paradise*, 31: 103-108). In *Vita nuova* (40.1) he refers to *quella immagine benedetta la quale lesu Cristo lascib a noi per essempla de la sua bellissima figura* ("that blessed image that Jesus Christ left us as exemplar of his most beautiful face"). During the later Middle Ages, the name Veronica, applied in the apocryphal (probably fourth-century) *Acts of Pilate* to the woman with an issue of blood who touched the

hem of Christ's garment (Matthew 9.20-22; Luke 8.43—48; Mark 5.25-34), became associated with the legend of the miraculous portrait. Giraldus Cambrensis (c. 1146—1223), in his *Speculum ecclesiae*, calls the cloth itself *veronica* and explains its name as deriving etymologically from the Latin-Greek hybrid *vera icon* ("true image"). Matthew Paris (c. 1200-1259) claims in his *Chronica majora* that Veronica was the name of the woman who gave the cloth (who was herself eventually venerated as Saint Veronica). The familiar narrative elaboration in the context of Christ's ascent to Calvary is first recorded in the fourteenth century, by which time devotion to the cloth itself was already well established.

Vicenza

Vicenza, a city and bishopric in northern Italy (Venetia), is situated at the northern edge of Mount Berici, where the Retrone and Bacchiglione rivers meet. The territory of the diocese of Vicenza is not identical with that of the county (*contado*), as it embraces an area extending to within a few miles of Padua, as well as a narrower strip of the area of Verona,

After the Roman *municipium* Vicetia had been conquered by the Lombards in 568-569, it was soon elevated to a ducal seat and developed into an important ecclesiastical and political center. The conquest of Padua in 603 permitted Vicenza to expand its own territory and gain ascendancy in the area between Treviso and Verona until well into the post-Carolingian period. Vicenza also played a role as the

residence of important and renowned Lombard family groups. The presence of a bishop, Horontius, is first documented c. 590. It is now taken as an established fact that Horontius was actually the first bishop of Vicenza.

The foundation of the oldest and most important monastery in Vicenza, Santi Felice e Fortunato, possibly dates back as far as the eighth century. Although the exact date of this foundation is obscure, it is known that the two largest abbeys of northern Italy, San Salvatore di Brescia and San Silvestro di Nonantola, expanded their landed properties and rights well into the area of Vicenza during the second half of the eighth century. Further documents dating from the eighth century tell us of a royal *gastald* as administrator of the royal fisc. The importance of Vicenza was confirmed when mint rights were bestowed on the town under King Desiderius (r. 756–774). In 825, the capitular of Emperor Lothar (Lothair) I made Vicenza the site of a school for all towns in eastern Venetia (Padua, Treviso, Feltre, Ceneda, Asolo), thus underlining its cultural position.

The county of Vicenza is documented without a break from the ninth century onward, although contemporary sources mention counts of Vicenza only occasionally. Presumably this office remained vacant at times—a not infrequent phenomenon, especially during the reigns of the Italian kings. In the Ottonian period (perhaps c. 970), we hear of a count of the counties of Vicenza and Padua. The general crisis of central power in the ninth and tenth centuries led to the legal and political breakup of the county, and to the development of a phenomenon called *incastellamento*. These processes began when the church and the secular lords started to obtain castles and procure sovereign rights, having assumed powers of jurisdiction as *signori* or *domini loci*, replacing the juridical authority of the public powers. Thus the bishop of Padua and monasteries in Verona and Mantua as well as several secular lords (the San Bonifacio or Sambonifacio family) owned castles and rights in the county of Vicenza. However, the episcopal church of Vicenza took a leading position among those wielding power: in the year 1000, Bishop Jerome received a diploma from Otto III granting him a range of privileges and confirming existing ones.

The secular and ecclesiastical sovereign rulers maintained their authority till the end of the twelfth century. Vicenza's economy, with its

exclusively agricultural base, was largely responsible for the relatively slow development of the city; in comparison with those of other northern Italian cities, Vicenza's social and economic structures do appear somewhat backward. The first record of consuls dates from 1147, in connection with the peace treaty of Fontaniva concluded between Vicenza and Padua. (In the first half of the twelfth century, the March of Verona was beset by incessant warfare among Verona, Vicenza, Padua, Treviso, and Venice over the control of waterways and overland traffic routes.) We can assume that Vicenza (like the other towns of the March of Verona) was subject to imperial control, either indirectly by the civic *podesteria* (city magistracy) or directly by imperial administrators. In the great political conflict between the Swabian emperor Frederick I Barbarossa and the cities of northern Italy, Vicenza took an anti-imperial stance. As early as 1164, Venice, feeling itself threatened by Frederick and accepting financial support from the Byzantine emperor Manuel Comnenos, set up an alliance against Frederick together with Verona, Vicenza, Padua, and Treviso. In 1167, Vicenza joined the Lombard League.

From 1175 on, power in Vicenza alternated between consulate and *podesteria* (both native and foreign); thus the families of the counts once again assumed leadership of the commune. During this period, the commune succeeded in overthrowing the most important castle in the territory, that of Bassano, which had already played an important role three decades earlier in the war between Padua and Treviso. After c. 1200, the counts and the family of da Vivaro were leaders of the commune. They always had control of the *podesteria*, whether directly or indirectly, the consuls generally belonging to their *domus*. Thus although the commune was an independent organism, its selfadministration was inextricably bound up with the large families who had moved from the surrounding territory into the town—*signoria* families who were often at odds with the bishop. The chronicler Gerardus Maurisius, who witnessed events in Vicenza and in the March of Verona between 1194 and 1237, does not mention the commune, but he does talk about families (one in particular, that of the da Romano, whose leader Ezzelino I was *podestà* from 1183 to 1184) and about the *partes* into which the town was divided: that of the da Vivaros and that of the count. In those years, Vicenza was thoroughly involved in the

quarrels among the large *signoria* houses in the March of Treviso. Certainly by the first decade of the thirteenth century, domination by the da Romano family, which would last for thirty years, had begun (first by Ezzelino II and then by his son Ezzelino III). After a group of students and lecturers had seceded from Bologna, an attempt was made, with the support of Pope Innocent III, to establish university studies in Vicenza, but this failed between 1205 and 1209, one reason being the political confusion prevailing at the time. A rough estimate would put the population of Vicenza at this time at 5,000—6,000.

Duomo, Vicenza. Photograph courtesy of John W. Barker.

The town community, largely controlled by the nobility, was not able to exploit the difficulties of its sovereign lord, the bishop, to its own advantage. Instead, Ezzelino III succeeded in ruling the town without restrictions and with the consent of all decisive social groups. Following the death of Frederick II and the defeat of Ezzelino III, Vicenza became independent for a short while (1259-1266). It was then under the influence first of Padua (especially in the years just after Ezzelino's death) and next of Venice (Vicenza had called for its support against Padua). Nevertheless, from the second half of the thirteenth century onward, the town did try to assert its autonomy with a fair amount of determination. During this short period of political autonomy, its independence was confirmed by the drawing up of *Regestum*

possessionum communis Vicentie and, soon afterward, the town statutes (1264), this compilation of statutes having been imposed on Vicenza by Padua. Both texts contain the list of demanded *ville*, organized in quarters, which the district of the town could claim but which in fact were only very fragmentarily within its control. By and large, in the second half of the thirteenth century, the town gradually managed to assert authority over the plains and the Colli Berici; in the valleys of the alpine foothills of Vicenza the seigneurial families still clung to their power and kept control of *masnade* and castles. How weak the commune really was became apparent when it entrusted the leadership of the town to Bishop Bartolomeo da Breganze in 1261 and handed generous powers over to him as if he were the undisputed leader of the community. All citizens swore an oath of loyalty, and for the next three years he was in *spiritualibus et ternporalibus civitatis Vicentinae dominus*. The weakness of the commune became yet more obvious when it was subjected to Paduan rule in 1266, forever losing its political independence. Furthermore, it was reduced by the loss of Bassano, which was handed over to the Paduan territory, with all the attendant losses regarding taxes and jurisdiction. Henry VH's march to Italy and his conflict with Guelf Padua led to Vicenza's being subjected to the rule of the imperial vicar Cangrande I Delia Scala as its *signore* (1311). In the fourteenth century, the wool-processing industry in Vicenza began to prosper, the town gained tighter control over its *districtus*, and the decline of the seignury, especially that of the bishop, entered into its last phase. After the overthrow of the Scaligers in 1387, Vicenza became dominated by Gian Galeazzo Visconti. Following his death, Vicenza was the first of the Venetian towns to submit to the republic of Venice (*deditio* April 1404); it would remain under the dominion of Venice until the end of the eighteenth century. The commune of Vicenza was governed by the patricians who had climbed to power in the thirteenth and fourteenth centuries, and it managed to retain a certain degree of independence during Venetian rule. Vicenza thus typifies those town communities that gained ascendancy over a certain territory, this in turn being subject to an external political power.

Pope Vigilius (a. 555, r. 537-555) had been a Roman deacon. In that capacity, he had accompanied Pope Agapetus I (r. 535-536) to Constantinople, where Agapetus was ambassador to the emperor Justinian for the Ostrogothic king Theodahad. Agapetus opposed the empress Theodora's efforts on behalf of Monophysitism, but the ambitious Vigilius chose to cultivate Theodora's favor, promising to support her aims. When Agapetus died in Constantinople (22 April 536), Theodora supported Vigilius as his successor.

Vigilius found, however, that Theodahad had already made Silverius pope. In December 536, Justinian's general Belisarius entered Rome during his first campaign to recover Italy in the Gothic wars. Through the general's wife, her friend Antonina, Theodora compelled Belisarius to arrange the deposition of Silverius (March 537) and the installation of Vigilius, who sent his predecessor to death in exile (2 December 537).

When he became pope, Vigilius found that he could not fulfill all his promises to the empress: though he made some double-dealing contacts with Monophysite prelates in the east, the consistent anti-Monophysite theology of the church in the west made it impossible for him to betray Chalcedonian orthodoxy. This enraged Theodora, who sought to punish him.

Partly as a result of her persuasion, Justinian adopted a policy, embodied in his Edict of the Three Chapters (544), aimed at achieving a compromise with the Monophysites by condemning certain disputed writings that had been accepted at the Council of Chalcedon (451) and were particularly hateful to them. Constrained by his situation, Vigilius refused to cooperate. Needing his support, and not wishing him to fall into the hands of the Gothic king Totila, who was then menacing Rome, Justinian had Vigilius arrested in November 545. Vigilius was removed for a year to Sicily, from which he sent grain shipments to aid the populace of Rome; he was then brought to Constantinople in January 547.

For the next eight years, Vigilius was caught in a nightmare of complicated negotiations, coercion, and humiliation as Justinian attempted to bend the pope to his will. Vigilius evaded, vacillated, resisted, and temporized, even in the face of force and even when the emperor called the Fifth Ecumenical Council (553). Only when Italy was clearly in the emperor's hands, and capitulation was the pope's

only chance for return to his see, did Vigilius give in on every point. Broken and degraded, Vigilius was allowed to leave Constantinople in the spring of 555; but during the return voyage, at Syracuse in Sicily, he died of kidney disease on 7 June, never to reach the Rome he had paid so dearly to recover.

Villani, Filippo

The Florentine humanist Filippo Villani (c. 1330-c. 1405) was the son and biographer of Matteo Villani, whose chronicle he continued for a brief period after Matteo died in 1363. Filippo is first recorded as a law student at the University of Florence in 1358; by 1361, he had been awarded his doctorate and was appointed as a lecturer in law for a year from the previous October. In 1375, he was entrusted by his commune with a diplomatic mission to Genoa, intended to resolve a legal dispute

between Genoese and Florentine cloth merchants. Following a rebellion by Perugia against the papacy, instigated by the Florentines during the "war of the eight saints," Filippo was invited to assume the chancellorship of Perugia, an office that he held from 1376 to 1381. After he resigned this position, he returned to Florence, and it was probably shortly after his return that he composed the work for which he is renowned: *On the Origins of Florence and On Its Famous Citizens*.

In the first part of this work, Filippo did little more than summarize the legends about the foundation of Florence recorded in the chronicle of his uncle, Giovanni Villani. But in its second part, made up of short biographies of distinguished Florentines, Filippo broke new ground by dealing not so much with leading political figures as with writers, theologians, jurists, painters, musicians, physicians, astrologers, historians, soldiers, and even actors and jesters. He thus provided valuable information on men who had made a significant contribution to Florentine culture but who had not previously been considered worthy of scholarly notice; moreover, he set a precedent that was to be followed later by authors writing in the vernacular, such as Vespasiano da Bisticci and Vasari. Filippo's work was corrected and commended by a friend, the Florentine chancellor and humanist Coluccio Salutati; thanks to Salutati's endorsement, it acquired considerable authority, both in its original Latin version and in a later vernacular adaptation, probably by Antonio Manetti.

The closing years of Filippo Villani's life were devoted to a study of the poetry of Dante; earlier, it had been Filippo's gathering of biographical data on Dante that first suggested to him the idea of producing a collection of brief lives. In 1391, Filippo was engaged by the University of Florence as a lecturer on Dante's *Divine Comedy*; his appointment to this position was renewed in 1397, 1401, and 1404. Filippo's public commentaries on this text continued an expository tradition that had been initiated by Boccaccio and engaged a number of leading humanists.

Villani, Giovanni

The Florentine chronicler Giovanni Villani (c. 1280-1348) was a merchant and politician as well as a writer. He was the author of the *Nuova cronica* (*New Chronicle*), a history of Florence set in a much wider context, beginning with the tower of Babel and extending to 1348, the year when he died of the plague. In this work, he combined

municipal patriotism and a cosmopolitan outlook with a passion for statistics and detail. Despite its length, it was (like Dante's *Comedy*) a great popular success, circulated in many fourteenth- and fifteenth-century manuscripts. However, although there were a number of subsequent printings, it was given a critical edition only quite recently (Porta 1990-1991).

Giovanni Villani was born into a mercantile family of some standing in Florence. Giovanni's father served a term as a prior—a member of the main governing board of the city—in 1300; and Giovanni and his three brothers were able to secure positions with two of the leading Florentine banking and commercial houses. Giovanni himself became a successful and rich businessman, though he must have lost most of his fortune in the great financial crash of the 1340s. He was also successful socially and politically. He married, as his second wife, a woman from the aristocratic Pazzi family; and he held a place in the ruling Florentine oligarchy, serving in various communal offices, including three terms as prior. His business career not only gave him intimate knowledge of the power struggles in his own city but also put him in touch with the wider world. He was able to travel extensively and receive reports from all over western Europe at a time when Florence was one of its richest and most populous cities. In this golden age, Florence enjoyed—as Giovanni observed in a meticulous statistical description of its trade and resources c. 1338—an income greater than that of many kingdoms. At this time, its banking and mercantile companies controlled and manipulated a disproportionately large concentration of capital and trade. Of these companies, the most powerful were the Bardi and the Peruzzi. As early as 1300, Giovanni was a shareholder with the Peruzzi firm, and c. 1302 he went to Bruges in its service; he was connected with it for a number of years, as were several of his relatives. Then, probably by 1312, but certainly by 1322, he transferred his activities to a new but rapidly growing firm, the Buonaccorsi, in which he and his brother Matteo became prominent—in fact, Giovanni was its codirector by 1324. Certainly by the late 1320s its operations were varied and widespread, including not only banking but also trading in many commodities, and extending over a vast area: southern and northern Italy, southern and northern France, Brabant, Flanders, England, and various parts of the Mediterranean. Although

Giovanni mentions other places from time to time, it is these regions of which he seems to have had real knowledge. At least for those chapters of his chronicle that cover the period 1300-1348, we may suppose that conversations, oral reports, and merchants' letters are at least as important a source as chronicles and official documents.

Giovanni's access to both official and private documents must have made possible his unusually rich and accurate statistics about such things as armies, tax revenues, cloth production, wine consumption, coinage parities, and the number of castles in private and in communal hands. No doubt his collection of such quantitative information was greatly facilitated by the various offices and appointments entrusted to him by his city and his guild. Apart from his three priorates, these were mostly financial. As a municipal official, for example, he supervised the commune's money and the building of a stretch of the third circle of walls. As an official of the Calimala guild, he served on the *mercanzia* council of eight and oversaw the making of Andrea Pisano's bronze doors for the Baptistry. He also went on some diplomatic missions: he was sent to Cardinal Bertrand de Pouget in Bologna in 1329 and a little later to negotiate (unsuccessfully) for the surrender of Lucca. Most of his officeholding was in 1320–1330. After that, he may have been under a cloud, having been tried for barratry in 1331 for his part in building the walls, even though he was cleared of the charge. The fact that Charles of Calabria, then lord of the city, entrusted to the Buonaccorsi company the collection of the taxes from three of the six districts of Florence to pay for the building of those very walls may not have helped Villani's reputation. But real disaster came later, in 1346, after the collapse of the great Florentine commercial companies. Then Giovanni was imprisoned for alleged misconduct as the representative of the Buonaccorsi in negotiations with the communal government about their bankruptcy liabilities. Giovanni does not mention this personal disgrace, but he does express remorse for his share of responsibility in the losses of the small investors in the great companies. We do not know how long his imprisonment lasted. He died in 1348, some two years after it began, and was buried in Florence in the church of the Santissima Annunziata. His brother Matteo and his nephew Filippo continued his chronicle.

For the most part, the opinions Giovanni Villani expresses in his

chronicle are remarkably balanced and moderate. His patriotism as a Florentine, for example, was real but not exaggerated. He knew that Florence was sometimes unjust to its neighbors, and though he praised its resilience and resourcefulness in times of crisis, he often deplored its lack of talent for war. He disliked *signori* and signorial government, but he could not always conceal his admiration for a despot as brilliant as Castruccio Castracani, despite the defeats Castruccio inflicted on Florence. Giovanni favored republican government and connected it with political liberty. But he bitterly condemned factional strife and considered the rule of a benevolent *signore* like King Robert of Naples sometimes necessary to restrain it. Villani was also critical of republican regimes representing one class, whether that class was aristocratic, mercantile, or (especially) artisan.

Giovanni was not only a moderate patriot and republican but also a moderate, though very loyal, Guelph. The rival Ghibelline party had been driven out of Florence in the late 1260s, before Giovanni was born, at the same time that the rule of the Ghibellines' Hohenstaufen patrons in southern Italy had given way to the rule of Charles of Anjou, called in by the pope to govern the kingdom of the Two Sicilies. The Ghibellines remained strong in the north and in some parts of Tuscany, but Guelph Florence, Angevin Naples, and the papacy, despite occasionally violent quarrels, were linked by strong economic and political bonds. For Giovanni, these bonds seem to have been ideological as well, reinforced by sincere religious feeling. He regarded Charles of Anjou as a new Charlemagne, summoned to Italy to rescue the Roman church from the Hohenstaufen Lombards. Giovanni devoted perhaps his most sustained literary effort to a long and eloquent account of Charles's Italian campaigns. He also portrayed Florence as usually an ally of the church, from the struggle between Pope Gregory VII and the Emperor Henry IV in the late eleventh century down to his own time. The intervals during the later period when the pope and Florence were at odds worried Giovanni, as did the taxation of the Florentine clergy without their consent by his own commune. At the same time, he did not hesitate to criticize individual popes and Angevin rulers for avarice and immorality, and his fellow Guelphs for factionalism. He thought that the expulsion of the White Guelphs in 1302 was disgraceful, but he was glad that their assault on the city in 1304 did not succeed. He was also glad

that Henry VII failed to capture Florence in 1312, but he said that the emperor's original intention had been to deal justly with Guelfs as well as Ghibellines. Such urbane judiciousness was appropriate to a rich businessman who numbered kings and princes among his acquaintances and had wide experience of the world.

In the prologue to the *Nuova cronica*, Giovanni says that his pride in the noble origins of his city and his desire to delight and instruct his fellow citizens had impelled him to write its history. In Book 9, Chapter 36, he relates that he began to write in 1300, after returning to Florence from Rome, where he had participated in the great papal jubilee. Seeing the ancient Roman ruins, reading the ancient histories, and reflecting on the decline of Rome had inspired him to tell the story of the rise of Florence, an offspring of Rome. Whether or not Giovanni began his chronicle immediately after his return to Florence, it is evident that he wrote primarily for Florentines and that one of his main purposes was to celebrate their successes without omitting their blunders and failures. The history of no other European city except Rome had hitherto been told at such length. Giovanni also conveys a sharp awareness of developments in the physical shape and monuments of Florence—for example, its central octagonal church, the Baptistery, which he says travelers assured him was the most beautiful in the world; its other churches and public buildings, whose siting and arrangement he compared, following an old Florentine historical tradition, with those of similarly named Roman monuments; the dimensions of its walls, towers, and bridges; and even the emblems on the banners of its militia and the decoration on its war cart, or *carroccio*. He is also aware that Florence is not just a city but a European power, and his ability to see Florence as part of a greater world is one of his main merits as a historian. Giovanni also likes to include a good story or a vivid detail, from wherever it comes. He touches on such topics as astral portents, monstrous births, costumes, public feasts, civil and religious rituals, relics, epidemics, earthquakes, inscriptions, apparitions, the lions behind the communal palace in Florence, coins, Gog and Magog, Muhammad, what might have happened, famous men (like Aquinas, Dante, and Giotto, of whom he writes pocket biographies), sea battles, sermons, governments, and expedients for increasing public revenue. Given such variety, it is no wonder that many critics have accused

Giovanni Villani of being episodic and lacking a unifying theme or point of view. Porta believes that Giovanni did revise the chronicle extensively but that his main purpose was probably to introduce new information at many points—a process made easier because the chronicle is for the most part organized not thematically but year by year.

Giovanni Villani, *Istorie fiorentine*. Milan: Società Tipografica de' Classici Italiani, 180. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Giovanni certainly wants to instruct as well as entertain and inform his readers. He says that he wants to show future Florentines which actions of their predecessors they should imitate and which they should avoid. The guidance he offers is more moral than intellectual. It is true that much shrewd commentary on business, politics, and war is scattered through his book, but he has no single large lesson to teach. His analysis of the secondary causes of a particular Florentine victory or defeat can be thorough and penetrating, as, for example, in his explanations of the failure of Florence to acquire Lucca after the death of Castruccio Castracani. Very often, however, he is content—as a devout and right-thinking Florentine Guelph—to attribute such disasters to the wrath of the deity at the wickedness of the Florentines: their

pride, avarice, and envy. Giovanni knows the Old Testament well, and his God, like Yahweh, is swift to punish. Sometimes, particularly in the later books of his chronicle, he seeks scientific, or at any rate astrological, explanations; but he consistently denies that the influence of the stars negates free will or men's responsibility for their actions, and he expresses again and again his conviction that the stars are immediately and totally subject to God's commands. He does try to account rationally for one great problem in thirteenth-century and early fourteenth-century Florence: factionalism. He does so by a literal application of Dante's metaphor about the opposition between the two peoples who, according to Florentine legend, shared in populating the city, the allegedly "noble and virtuous" Romans and the allegedly "rough and fierce" Fiesolans. For Dante, "Romans" were all those willing to submit to the emperor's laws; "Fiesolans" were those "barbarians" who resisted it. For Giovanni Villani, the two names designate two peoples who actually participated in populating Florence and whose imperfect mixing produced chronic strife. He finds the story of this mixing in the *Chronica de origine civitatis* (written before 1231) and its Italian translations. (It is very unlikely that he was able to find the origin, as some scholars have maintained, in the so-called Malispinian chronicle, which was almost certainly written after his own and was largely copied from a compendium of his work.) In the *Chronica de origine civitatis*, the Roman origins of Florence were exalted and Julius Caesar himself was included among the founders of the city; but though the Fiesolans were represented as fierce enemies of the Romans, they were not depicted as barbarians. This Giovanni could have found in no surviving work before Dante's *Inferno*, circulated c. 1314. Probably Giovanni was also paraphrasing Dante's words in *Paradiso* (15.109-111), as Aquilecchia (1965) has suggested, when he referred in Book 9, Chapter 36, to the rise of Florence and the decline of Rome.

Up to this point in his chronicle, Giovanni is mainly concerned with describing the steady ascent, despite occasional disasters, of Florence, the child of Rome. Afterward, misfortunes multiply and the direction of Florence's development is not so clear. But Giovanni retains much of his optimism until the 1340s, the imposition and overthrow of Walter de Brienne's regime, and the subsequent financial crash. Neither communal nor personal calamities slowed the chronicler's busy pen. It

continued right up to his death to provide an invaluable picture of the attitudes of the fourteenth-century oligarchy of Florence toward its past and present, and, especially for the period from c. 1320 to 1348, a narrative source for medieval Florentine history of inexhaustible richness and variety.

Villani, Matteo

Matteo Villani (d. 1363) was the father of Filippo Villani and the brother of Giovanni Villani, whose chronicle he continued from Giovanni's death in 1348 until his own. Relatively little is known about Matteo's early life. He was the son of V'illano di Stoldi di Bellincione and, in 1337-1338, under the name of Matteo Villani Stoldi, was a member of a committee of officials charged with carrying out the terms of an alliance with Venice and several Lombard states. His involvement in civic politics appears to have ended, like his brother's, as a result of the bankruptcy in 1342 of the Bonaccorsi company; he was a partner in the company and had represented it in Naples between 1319 and 1325 and between 1340 and 1341, and in Avignon between 1333 and 1335. Despite belonging to a family with a record of service to the commune up to the 1330s, Matteo failed to find favor with the more conservative groups which, from the late 1350s onward, sought to exclude their opponents from government by "admonishing" them as Ghibellines. In 1362, shortly before Matteo's death, this device was used against him, to debar him from office. His undistinguished political career did not, however, prevent him from marrying women from highly regarded Florentine families. He is recorded in 1341 as the husband of Lisa, the daughter of Messer Monte dei Buondelmonti; and in 1361 as the husband of Monna di Messer Francesco dei Pazzi.

Matteo's chronicle, which opens with an account of the black death, is pessimistic in tone and focuses on the misfortunes and barbarities of his age—the threat of tyranny, the depredations of the mercenary companies, and the decline of morality in the years following the pestilence. His interpretation of events is governed much less than that of his brother, Giovanni, by a providential view of history. In his tendency to judge actions by their effects and to defend abstract values such as freedom rather than a particular cause, such as that of the church, Matteo anticipates humanist practice—as he also does by prefacing his books with introductory passages reflecting their texts. While his writing remains stylistically within the tradition of the merchant chronicle, the outlook he expresses foreshadows the values of a new age.

Virgil

Virgil (Publius Virgilius Maro, 15 October 70-21 September 19 B.C.) was born near Mantua to a family of modest landholders. He was probably educated in Rome and Naples, although precise details about his early life are not known. In 41 B.C., many landowners around Mantua were dispossessed by confiscations intended to compensate veterans of the conflict at Phillipi. Ancient notices link Virgil's father and family to this turmoil, implying that their property was appropriated but then restored to them through the intervention of a powerful administrator; however, the historical accuracy of this account is not clear. At some

point Virgil settled in Rome and quickly became acquainted with an influential group of politicians and literati. After 39 B.C., Virgil gained the patronage of Maecenas and through him entered the circle of Octavian, who was known as Augustus after 27 B.C. The remainder of Virgil's life was devoted exclusively to poetry. In 29 B.C., Virgil read the *Georgics* to Augustus, and he later read to Augustus portions of the *Aeneid* as well. Augustus was very supportive of Virgil's effort and tracked the development of the work with personal interest. Virgil died in Brundisium and was buried in Naples. Although the poet had considered his masterpiece unfinished—and, according to tradition, had asked his literary executor to burn the *Aeneid* if death prevented its completion—Augustus arranged for its publication shortly after Virgil's death.

The earliest work definitively attributed to Virgil is a collection of ten brief poems known as the *Eclogues* or *Bucolics*. The poems, all composed in hexameters, were written between 42 and 39 B.C. The poems continue a genre popularized by the Hellenistic poet Theocritus (c. 310-250 B.C.), in which an idealized pastoral landscape forms the backdrop for a community of shepherds who discuss love and poetry. Like Theocritus, Virgil sets his poems in a bucolic countryside, an Arcadia that bears as little resemblance to the Greek region known by that name as it does to any place in the real world. Despite the rarefied setting of the poems, Virgil's *Eclogues* manage to take up political and social issues of the time: the first and ninth poems, for example, refer to the expropriations near Mantua in the wake of the civil wars. Several of the poems treat the topic of desire; the second and eighth eclogues consider unrequited love, with the latter imagining a lovesick woman resorting to witchcraft. The best-known of the eclogues is the fourth. Here, the narrator prophesies the birth of a child who will usher in a blissful era of peace, a golden age. The poem does not reveal the young boy's identity, and although possible answers to this question have been proposed—including the early Christians' conjecture that Virgil prophesied the coming of Christ—the puzzle remains unsolved.

Virgil, *Opera vergiliana*. Lyon: J. Mareschal, 1528. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Virgil's second collection, the *Georgics*, completed in 29 B.C., moves from the pastoral to the didactic genre. In four books of hexameters, Virgil instructs his readers on various aspects of agriculture and animal husbandry. The first book considers the cultivation of crops; the second,

arboriculture; the third, livestock; and the fourth, beekeeping. The poem, however, remains a work of art rather than a manual; Virgil's object is to examine the relationship of man and nature, and the sizable digressions that conclude the books serve to link the work to larger issues of life and death, the country and the city, and the greatness of Rome. Book 1 ends with an apocalyptic vision of the civil wars. The digression in Book 2 first praises rural life, then sets forth Virgil's own poetic ambitions. Book 3 describes a devastating animal plague. Book 4 offers the story of Aristaeus and Orpheus, a tale of love, loss, and rebirth. Like Lucretius's *De rerum natura*, which influenced the *Georgics* both formally and thematically, Virgil's poem is diversified and elevated by these set pieces.

Virgil's interest in the history and destiny of Rome take center stage in the *Aeneid*. This epic, divided into twelve books of hexameters, recounts the founding of Rome by the Trojan warrior Aeneas. The first half of the epic narrates Aeneas's journey from his destroyed city to Italy. Aeneas and his crew are shipwrecked near Carthage and are welcomed by its queen, Dido. Aeneas describes the dire final hours of the Trojan war, in which he loses his wife and carries his aged father from the city on his shoulders, and recites his crew's subsequent nautical adventures. He concludes his tale with the account of his father's death. Dido conceives an irrepressible love for Aeneas, which is reciprocated until the voyager is recalled to his foreordained task by the gods. When Aeneas prepares to depart for Rome, Dido kills herself. In the sixth book of the poem, Aeneas voyages to the underworld, where he encounters his father's ghost. His father reveals to him the course of Roman history, concluding with events nearly contemporary to the composition of the poem. The first half of the epic has traditionally been considered Virgil's version of Homer's epic the *Odyssey*, since, like Homer, Virgil tells of a traveler's adventures after the Trojan war.

The second half of the *Aeneid*, in which a bloody war is waged, naturally suggests comparisons with Homer's other epic, the *Iliad*. In Book 7, Aeneas reaches the Tiber and makes a pact with the king of the native Latins. When the goddess of discord intervenes, war breaks out. The Trojans and their allies, the Arcadians and Etruscans, take heavy losses. Finally, once the gods reach an accord among themselves, Aeneas kills Turn us, the man betrothed to the Latin king's daughter, Lavinia, effectively ending the conflict and allowing for the destined

union of the Trojan and Latin peoples. The poem ends on an ambivalent note, however; we know that Aeneas is fated to marry Lavinia, but the last lines of the epic emphasize Aeneas's merciless violence rather than any spirit of reconciliation.

From one point of view, the *Aeneid* represents as much a monument to Augustus's program of national mythologizing as any of the emperor's many building projects. The poem functions as a bridge between ancient Rome and the mythical past of the Trojan war and thus helped endow Augustan Rome with a sense of its own historical importance. A contrary view, however, is that, while Virgil certainly contributes to Augustus's political ideology, there is ample occasion for the reader to discern the poet's own uneasiness with the more brutal aspects of the empire. In either case, the poem became the model against which any subsequent epic work was considered. It stood—and continues to stand—as one of the most significant literary contributions to western culture.

Virgil in the Middle Ages

From the early days of imperial Rome, Virgil was regarded as the greatest Roman author, and his poetry was venerated as a repository of religious tradition and universal knowledge. The fullest expression of this attitude, which reached its peak during the "pagan revival" of the later fourth century, is the *Saturnalia* of the learned official Macrobius (c. 431), but it appears also in an ancient practice, the *sortes Virgilianae*, in which a passage selected at random is used to determine conduct or foretell the future. In the schools, the elaborate commentaries of Servius, Donatus, and others—largely grammatical, but including many glosses of a moralizing, euhemeristic, allegorical, and occasionally philosophical character—solidified Virgil's reputation as a sage and visionary.

Virgil's place in Christian literary culture was almost equally high. The "messianic" prophecy of *Eclogue* 4 was commonly taken as foretelling the birth of Christ, and Augustine repeatedly invokes the *Aeneid* in defining the mission of Rome as a vehicle to the realization of the city of God. The Latin fathers continually allude or refer to the *Aeneid*, allegorizing like the grammarians. There is also a rich tradition of Christian poetry in Virgilian style. Juvencus's version of the Gospels in Virgilian hexameter (c. 330) was a frank attempt to exploit Virgil's popularity; and the great Prudentius (348–405) assumes in his reader the familiarity with Virgil which the education of the period ensured. The hymns of Ambrose (340–397) allude to familiar contexts in the

Aeneid; and Sedulius, seeking to convey the joys of paradise in his *Carmen paschale* (c. 430), cites the idyllic landscape of the *Eclogues*, the "happy crops" of the *Georgics*, and the Elysium of *Aeneid* 6.

Virgil retained his status during the postclassical period. A famous letter from Pope Gregory I (540–604) chastising Bishop Desiderius of Vienne for teaching Virgil is aimed not at the study of Virgil but only at its unsuitability for a bishop. Virgilian Latin verse seems to have survived in Italy as well. Even in the dark century after Gregory and Fortunatus (535–600), Virgilian echoes are heard in the *tituli* of churches and other inscriptions, and the tradition reemerges strongly with the eighth-century Lombard scholar-poets Paul the Deacon (720–800) and Paulinus of Aquileia (726–802). During the ninth and tenth centuries the appearance of new manuscripts of Virgil's works and the enrichment of libraries at such centers as Bobbio and Cremona attest to a more general renewal of classical studies. The poet who, in 915, celebrated the imperial coronation of King Berengar with a *Panegyricon* in skillful elegiacs was probably a teacher of Virgil's work: his many allusions to the *Aeneid* are explained by elaborate Servian glosses. In the offhand Virgilian references of Liudprand of Cremona (920–971 or 972), secular culture is taken for granted, and this is true as well of Latin poetry, which remains dominant through the eleventh and twelfth centuries. An occasional poet, like the anonymous author of the *Gesta* (1162–1166) of Frederick I, will consciously emulate the epic style, but to say that the verse of the Cassinese poets Guaiferius and Alfamus, Moses of Bergamo, or Pietro da Eboli is "Virgilian" is merely to say that they are educated men of their day.

Awareness of Virgil takes other forms in this period. In two eleventh-century manuscripts, speeches from the *Aeneid* appear with musical notation, and from the twelfth century forward Mantuan coins were stamped with Virgil's likeness. Harder to explain is the proliferation of a body of popular legends concerning the poet's supposed powers as a magician. Such stories may recall the oracular Virgil of the *sortes* and the putative prophecy of the *Fourth Eclogue*, perhaps augmented by the knowledge of magic exhibited in the incantatory love song of *Eclogue* 8. Many stories center on Naples, where Virgil spent much of his life and where he was buried, and collectively they make him a virtual patron saint. According to one of these stories, he created a bronze fly which,

when placed on a city gate, kept Naples free of flies; another tells of a glass bottle containing a miniature "image" of the city, which preserved the city from attack for as long as the bottle remained unbroken. Other stories deal with his power to banish serpents, prevent meat from spoiling in the market, and even deodorize Neapolitan latrines; the location of his burial place; and the properties associated with his bones. These legends were given wider circulation by Conrad of Querfurt, viceregent of Naples and Sicily in the late twelfth century; and by the itinerant Englishmen John of Salisbury (*Policraticus*, 1159) and Gervase of Tilbury (*Otia imperialia*, 1211). The legends became known throughout Europe and appeared in many vernacular versions.

The literary activity of thirteenth-century Italy responded to French vernacular literary culture and to a new narrative form, the romance. The earliest romances, the so-called *romans d'anti-quité*, include the anonymous *Eneas* (1150-1160), an adaptation of the *Aeneid* which grafts an elaborate account of the flowering of Aeneas's love for Lavinia onto the story of his imperial mission. In the *Roman de Troie* of Benoît de St.-Maure (c. 1165), a rambling account of the Trojan war, the amours of Greek and Trojan heroes are again prominent. The influence of these works, in a period of growing demand for popular adaptations of classical literature, was immense, in Italy as elsewhere, and the ancient poets lost something of their traditional status. The *Historia destructionis Troiae* of Guido delle Colonne (1287), itself widely influential, pays due respect to the classical poets, but its chief source is Benoit. Guido and Benoit together underlie the several vernacular works of Trojan "history" produced in fourteenth-century Italy, and provide material for even so learned a production as the *Tresor* of the protohumanist Brunetto Latini. Whatever of Virgil survives in all this has hardly more to do with the classical epic and the classical world than the claims of Padua and other Italian cities to have been founded by Virgilian heroes.

Against this medievalizing background, Dante's Virgil stands out: with striking clarity. From early in his literary career, Dante is set apart from his contemporaries by the precision with which he notes the distinctive characteristics of the great Roman poets and offers them as models for imitation. For Dante, working in the classical tradition involves not just a painstaking synthesis of verbal echoings (as is all too

often true of the Latin poetry of the schools) or an adaptation of classical themes to new literary modes (as in the work of the French vernacular writers), but a profound assimilation of the defining qualities of style and vision.

The realization of this ideal, die Virgil of the *Commedia*, is something more than an authority on the origins and triumph of Rome. Like the Virgil of the ancient schools, he is a figure of exemplary wisdom, and

Dante gives a new coherence to his traditional role as a prophet: the *Aeneid* is a tragedy, fatalistic and circumscribed by the spiritual horizons of paganism, but it is at the same time a secular testament, and its proclamation of the destiny of imperial Rome is a worldly counterpart to the Pauline and Augustinian vision of the mission of the church.

But the figure who appears to Dante in the dark wood and becomes his guide is above all a poet, unique in the elevation of his language and style, a speaker whom only Dante can rescue from the "long silence" in which he languished during centuries when an impoverished classical tradition was incapable of appropriating his power. Dante's *bello stile* will appropriate that power. This profound affinity of style and the sense that his *Commedia* is a new realization of the capacities of high poetry, an extension of the epic tradition, lead Dante to identify himself, in *Inferno* 4, as one of the great poets, a member of the "school" of Homer.

In the years following Dante's death in 1321, there is a steady increase in versions of classical literature, including a number of adaptations of the story of the *Aeneid* that draw directly on Virgil, but only Petrarch sought to rise to the level at which Dante had addressed the epic tradition in the *Commedia*. Like Dante, Petrarch views the challenge of imitating Virgil as both aesthetic and moral. Petrarch's *Secretum* and his famous account of his ascent of Mont Ventoux are charged with allusions comparing his own struggles to the labor and vicissitudes of Aeneas. Like Virgil's, his Latin *Eclogues*, the *Bucolicum carmen*, include a number of reflections on the character and evolution of his life as a poet; and his Latin epic, *Africa*, on the triumphs of Scipio, carries forward the historical narrative begun in the *Aeneid*, consciously building on the tradition of Christian-Virgilian epic inaugurated by Dante.

Boccaccio offers no such monument as these; his classical narrative poems—*Filostrato* and *Teseida*—are in the tradition of the *roman d'antiquité*, and only in the remarkably Virgilian style of his *Eclogues* does he take up a classical model directly. But Virgil emerges as the "hero" of the great defense of poetry in the concluding books of *Genealogia deorum gentilium* (1363-1366), the supreme exemplar of Boccaccio's claim that the dedication, learning, and spirituality of the

greatest poets enable them to express divine truths. The arguments of *Genealogia* reappear in a lecture on *Inferno* 1, as an extended gloss on Virgil's *poeta fui*. Curiously, an accompanying gloss recalls the Virgil of medieval legend (whom Dante and Petrarch had ignored), the "astrologer" who performed wonders on behalf of Naples. At the very end of the Middle Ages, this juxtaposition of popular tradition with lofty humanism provides an apt summary of the fortunes of Virgil during the medieval period.

Visconti Family

The Visconti, a Milanese family, established a powerful lordship over Milan and much of northern Italy in the thirteenth through the fifteenth centuries. The Visconti can be traced to the tenth century, when they were a family of *capitanei* linked by ties of vassalage to Archbishop Landulf II of Milan (r. 978-998 or 999). From Landulf, they received the archiepiscopal revenues of the *pieve* of Marliano (today Mariano), which they were recorded as possessing in a judgment of 1157. They held the vicecomital office, which they made hereditary, turning the title into the family name Visconti. An Anselmus *vicecomes*, mentioned in 1067, is the earliest known member of the family.

The Visconti took a leading role in Milanese politics beginning in the thirteenth century, when Otto (1207-1295) was appointed archbishop by Pope Urban IV (1262). The Delia Torre, who then controlled Milan and were rivals of the Visconti, refused to recognize the election; however, Otto, putting together a force of Visconti exiles, defeated Napoleone Delia Torre at the battle of Desio (20–21 January 1277). When he entered the city, Otto was proclaimed lord (*signore*) by the *popolo*. Archbishop Otto ceded the lordship to Marquis Guglielmo VII of Monferrato for reasons of military convenience, but in 1282, Otto reasserted himself, and he was again proclaimed lord of Milan. Before Otto died, a succession to power was arranged for his grandnephew Matteo I (1250-1322), who was elected captain of the people (1287) and was granted the imperial vicariate (1294). In 1302, the Visconti were ousted by the Delia Torre faction (known as the Torriani), but Henry

VII of Luxembourg restored the Visconti to Milan and made peace between the two factions. In 1311, the Visconti instead chased out the Torriani, and in that year Matteo I was given a new imperial vicariate. In these factional struggles, the Torriani were aligned with the Guelf powers—the papacy, the Angevins of Naples, and the French—while the Visconti were staunchly Ghibelline. After the death of Henry VII and the double election in Germany, Pope John XXII declared all of Henry's imperial vicariates invalid; Matteo I then abandoned the imperial title and had the *popolo* proclaim him lord. Matteo greatly extended the Milanese state, absorbing Como, Bergamo, Piacenza, Tortona, Alessandria, and Pavia. This aggressive territorial policy resulted in Matteo's excommunication and a papal interdict, during which (one source tells us) Matteo discussed inviting Dante Alighieri to use necromancy against John XXII. After Matteo's death in June 1322, his successor, Galeazzo I, was forced to leave the city, but that same year Galeazzo was called back and proclaimed lord. In 1327, when Lewis of Bavaria came to Milan and was crowned king of Italy, he imprisoned Galeazzo on suspicion of plotting with the pope against him. However, the two were reconciled, and in 1328 Lewis conferred the vicariate on Galeazzo's son, Azzo (1302-1339), for the price of 60,000 florins. Azzo extended Milanese rule, pacified the factions, and established solid relations with other cities in the Po Valley. The feud with the Torriani having ended, the Visconti lordship became more stable. Milanese communal institutions were transformed, as the older councils became consultative and administrative bodies, while executive functions passed to the Visconti and their appointed officeholders.

When Azzo died with no heir, the Milanese elected as his successors his two uncles, Luchino (1292–1349) and Giovanni (1290–1354, archbishop of Milan). At first, affairs were controlled by Luchino, who took Asri and Parma, won the papal vicariate, and established a hereditary succession for the Visconti house. Then, after Luchino's death, Archbishop Giovanni took charge, acquiring Bologna (1350) and Genoa (1354). Giovanni was succeeded by three sons of his dead brother Stefano: Matteo II (1319-1355), Bernabo (1323-1385), and Galeazzo II (1320-1378). The Visconti lordship reached its highest point with Gian Galeazzo (Giangaleazzo, 1351 — 1402), the son of Galeazzo II, who in 1385 put his uncle Bernabo in prison and became sole lord of

the Visconti lands. Gian Galeazzo extended the control of the Visconti to Verona, Padua, Pisa, and Siena. In 1389, he married his daughter, Valentina, to Louis, duke of Orleans; this match became the basis for the claim of Louis XII to Milan in the sixteenth century. In 1395, Gian Galeazzo purchased the title of duke from the emperor Wenceslas for 100,000 florins. After the dramatic death of Gian Galeazzo from the plague in 1402, and a period of weakness under his brother, Giovanni Maria (1389-1412), the duchy passed to Filippo Maria (r. 1412–1447) who married the widow of the *condottiere* Facino Cane and substantially rebuilt the state. Filippo Maria died without a legitimate heir, and there ensued a brief political experiment known as the Ambrosian republic. The lordship then passed to the Sforza family, after it was seized by Francesco Sforza, who had married Filippo Maria's illegitimate daughter.

In *Convivio* (4.20.5), Dante praised the Visconti lineage, but he denied them nobility, "since the divine seed does not fall on bloodlines . . .; it falls rather on individual persons."

Visigoths

By the late third century, the loose confederation of tribes that the Romans collectively called Goths had coalesced into two fairly cohesive groups, the Ostrogoths and the Visigoths. In 332, Emperor Constantine I made a treaty between Rome and the Goths, which brought Gothic troops into the Roman army and increased the trade between the two peoples. During these interactions, Christianity spread across the Danube to the Gothic people. At first Gothic leaders persecuted converts, but one chief, Fritigern, supported Christianity and received aid from the Arian emperor, Valens. The famous Gothic bishop Ulfilas (d. 383) forwarded Arian Christianity among the Goths. During his pastorate, he translated the Bible into Gothic. Arianism then became closely associated with Goths, and it was a continuing cause of separation and controversy between the Go ths and Romans for centuries.

In 376, Huns attacked the Visigoths, and the Christian Fritigern received permission to bring his band of Visigoths across the Danube and settle safely in the empire. The land given to the Visigoths would not support the tribe, so Fritigern began a revolt that led to a Gothic victory over the Roman forces at Adrianople in 378; Emperor Valens was killed in this battle.

For the Visigoths, the next three decades involved intermittent wandering and raiding. Fritigern had been searching for land that

would keep his people safe from starvation and marauding Huns, while the empire was looking for a way to keep itself intact from encroaching "barbarians." In 382, Emperor Theodosius I (the Great) made the Visigoths Roman *foederati* and granted them settlement in Thrace. But under their new leader, Alaric, they rebelled and threatened Constantinople itself. The eastern court at Constantinople made efforts to buy them off, but they pillaged their way through Greece and then moved on into Illyricum, territory disputed between the eastern and western courts. Because of the tension between the courts, the western generalissimo Stilicho avoided a decisive confrontation with Alaric's forces, which remained in Illyricum for about a decade, playing off both courts. Alaric had made one unsuccessful foray into Italy in 401, and in 408 he renewed his effort seriously, with menacing effects. The fall and execution of Stilicho that year removed Alaric's one real obstacle. While the vapidity Emperor Honorius remained safely in Ravenna, Alaric advanced on Rome and found it defenseless. For three days in August 410, Alaric's Goths sacked the city without opposition—an episode that was not at all decisive immediately but was regarded as a symbolic calamity at the time and has been considered a pivotal event ever since.

The Visigoths—having no intention of occupying Rome permanently and no capacity to do so—moved south through Italy. Alaric hoped to lead the Visigoths to the rich lands of North Africa, but his plan was foiled when his ships were wrecked in storms before he could cross to Sicily. Alaric decided to move north; however, he died suddenly at the end of 410. His successor, Aistulf, assumed the task of leading the Visigoths out of Italy, and their renewed search for suitable lands brought them to southern Gaul. Aistulf compelled Honorius's sister Galla Placidia to marry him (414), and he received official Roman recognition for their settlement, which, in effect, created what was to become the first of the so-called barbarian successor states replacing Roman rule in the western territories. Entering Spain (416-418) on Roman authority to restore order, the Visigoths made a second effort to reach Africa; they were again unsuccessful, and their regime was consolidated for some years again around Toulouse in southern Gaul, in their capacity as Roman *foederati*. In 451, they supported the Roman government against the penetration of Attila and the Huns into Gaul.

Later in the fifth century, the Visigoths extended their rule firmly in

Spain, but in 507 the Franks deprived them of their original lands in southern Gaul. This confirmed the identity of the Visigothic kingdom as ruling the Iberian peninsula. It was only minimally affected by the reconquest program of Emperor Justinian I. The Visigothic regime survived, in increasing decadence, until the beginning of the eighth century, when it was easily destroyed by the Moorish and Arab invasion of 711.

Vitale Da Bologna

The earliest document mentioning the painter Vitale da Bologna (died c.

1359 or 1361) refers to his completion of a chapel in San Francesco in Bologna in March 1330. This and another chapel in San Francesco, which Vitale finished in 1340, are now lost; but a fresco of the *Last Supper* and flanking saints in the guest house of that church is apparently mentioned in a document of December 1340. This damaged fresco would be Vitale's earliest datable work. The *Madonna del Denti* in the Davia Bargellini Gallery in Bologna is signed and dated 1345. Two of the four saints that originally flanked this Madonna were formerly in the Lanckoronsky collection in Vienna. This altarpiece came from an oratory adjoining the church of Sant'Apollonia di Mezzaratta in Bologna, where it was accompanied in the seventeenth century by two wings of a polyptych, now in the city collection and once apparently part of the same work. Some detached frescoes in the Pinacoteca, originally in Sant'Apollonia di Mezzaratta, while not strictly documented, are supported by a strong local tradition and may be attributed to Vitale and dated to around the time of the *Madonna dei Denti*. The most important of these frescoes is a large *Nativity*. A payment voucher of 1349 proves that Vitale decorated the Saint Nicholas chapel in the *duomo* of Udine; these frescoes survive in somewhat better condition than the ones from Mezzaratta. An unsigned but documented polyptych of the *Coronation of the Virgin* in San Salvatore, Bologna, was commissioned in July 1353. Other documents establish the date of Vitale's death between June 1359 and July 1361.

Signed, but not dated, are the *Madonna of the Flagellants* in the Vatican Pinacoteca, *Saint George and the Dragon* in the Pinacoteca at Bologna, and some work in Santa Maria dei Servi, Bologna, not done before c. 1345-1348, when the church was built. The frescoes of *Saint Eustace*, *Christ in Majesty*, and other subjects in the apse of the abbey church at Pomposa, possibly 1351 (the inscribed date, which is unreliable), are generally attributed to Vitale. Important among the panel paintings that may be ascribed to him are four panels from the legend of Saint Anthony Abbot in the Pinacoteca, Bologna, possibly from a signed polyptych mentioned in an eighteenth-century manuscript; a diptych of the *Adoration of the Magi* and the *Man of Sorrows* now divided between Edinburgh and the Longhi collection in Florence; and two Crucifixions, one in the Thyssen collection in Lugano and one in Philadelphia. Their chronology is uncertain, but all seem to

be mature or late works, with the possible exception of the last. In 1343, Vitale agreed to furnish four polychromed wood statues to the bishop of Ferrara. These are lost or untraced, and no sculpture is currently attributed to him.

Although Bologna had been a major center for the production of illuminated manuscripts since the mid-thirteenth century, it had little indigenous panel or fresco painting when Vitale's career began. Various panels that were once thought to show his influence may in fact be early enough to have affected his style. Some of these, as well as Vitale's juvenilia, were inspired by the School of Rimini, through which the innovations made around the turn of the century at Assisi, and giottesque and Sienese styles, were transmitted to Emilia. A polyptych from Giotto's workshop was in Santa Maria degli Angeli in Bologna and is now in the Pinacoteca. It inspired Vitale's *Madonna dei Dentil*, but despite this and other apparent borrowings from Giotto, Vitale's art is generally more Gothic than Giottesque, and it shows a stronger imprint of Simone Martini and Pietro Lorenzetti.

Many of Vitale's works, particularly his frescoes, are fluidly executed, with sharp contrasts of light and dark. The figures are expressively contorted, with lively flashing glances. The compositions are built up of isolated compartments that are not interrelated by means of a visually consistent figure scale or spatial continuity. Here, parallels to the sculpture of Giovanni Pisano are so close that a strong influence should be assumed.

Similarities have been noted between Vitale's work and the *Triumph of Death* and other frescoes in the Camposanto at Pisa. These frescoes are usually, though not universally, attributed to the Pisan painter Francesco Traini. Their style is shown in some frescoes in the baptistery of Parma, not far from Bologna. Furthermore, some images of the Madonna and child by Vitale resemble a panel at Princeton that is generally ascribed to Traini. It is often claimed that Vitale influenced the painter of the Camposanto frescoes, but it is more likely that the influence went the other way. Proponents of the former theory sometimes hold that the painter was not Traini or some other Tuscan but an Emilian follower of Vitale.

Vitale da Bologna had a profound impact on panel painting, fresco painting, and manuscript illumination in Bologna until the end of the

fourteenth century. His style spread throughout much of northeastern Italy, even penetrating into Bohemia.

Viterbo

Physical Characteristics and Origins

Viterbo, situated about 50 miles (80 kilometers) north of Rome on a major pilgrimage route, was an important regional power in the Middle Ages, the chief local rival to Rome, and a papal resort and stronghold. Although later mythologizers attributed its founding to Hercules and Noah, the first settlement was Etruscan. The site of Viterbo was not a center of habitation in the Roman or early medieval period, but it was

settled by the Lombards in the eighth century as a frontier outpost. Archaeological research has confirmed Viterbo's accounts of its early history, according to which settlement began in three distinct locations that coalesced to form Viterbo.

Viterbo is built on several ridges that bordered a small river (which was buried in the early twentieth century) at the foot of the Cimini mountains. It is in a volcanic plain that slopes to the Tyrrhenian Sea, about 30 miles (48 kilometers) to the west. Via Cassia (the medieval Via Francigena) runs through the city, on its way from Rome into France.

Viterbo preserves many physical traces of its medieval past. Its walls, though early modern in their present form, follow the course of the medieval walls. They and the churches, fountains, and houses were all constructed in a local dark-gray stone called *peperino*. The San Pellegrino quarter of the city is remarkable for its medieval houses. Medieval and baroque fountains—one of Viterbo's distinctive features—are scattered throughout the city. There are a number of small eleventh- and twelfth-century parish churches, as well as the Romanesque cathedral of San Lorenzo. San Lorenzo shares a *piazza* with the impressive thirteenth-century papal palace, which has a lovely Gothic loggia. The important mendicant churches on the edges of Viterbo were extensively damaged in World War II. San Francesco has been reconstructed and preserves two important medieval papal tombs, but the Dominican church of Santa Maria in Gradi remains an inaccessible ruin. Viterbo's thirteenth-century patron saint, Rose, is still an important figure in civic life. Both her (presumed) house and her body are preserved for viewing.

Municipal Institutions

The institutional history of Viterbo centers on the complex interactions of the various powers claiming some authority over the city and its citizens. As a Lombard foundation, it had a count, but by the time Viterbesi documents began to survive in any quantity, in the late tenth century, Viterbo's communal government was already negotiating as the count's equal. Counts disappear from Viterbo's records in the twelfth century, but nobles, especially those based in the country

surrounding the city, persisted. The most prominent nobles in Viterbo's records are the Di Vico, whose center of power was southeast of Viterbo. They were often allied with Viterbo's enemies, the Romans and the emperor, in the thirteenth century, but they became dominant as *signori* of the city's government in the fourteenth century.

Under the Carolingians, Viterbo and its region became a part of the papal state or patrimony of Saint Peter in Tuscia. Papal rule only occasionally affected the internal workings of Viterbo's government, at least until 1285, when Viterbo lost to the popes the privilege of choosing its own *podestà* (city magistrate).

In Viterbo, unlike many other northern and central Italian cities, the bishop was a minor figure in the city's power structure. In fact, during the early years of its development as a commune (a phase when bishops were often particularly influential elsewhere), Viterbo had no bishop; it did not acquire a bishop until the see was moved there from Tuscania in 1193 by Pope Celestine III. Later, the bishops were overshadowed by other powerful figures and even had to move from their residence whenever a pope arrived.

Viterbo's commune first appears in documents in the late eleventh century. At that point it was led by elected consuls, whose number varied between ten and two. The first mention of a *podestà* is in 1170: Ildebrandino, a member of the old comital family of the region. After a succession of consuls and *podestà*, the *podestà* began, c. 1220, to be the usual leader of the commune. Until 1285, the *podestà* and consuls were chosen, through a complex form of election, by the special council. After 1285, the *podestà* was appointed by the popes.

The commune also had three main assemblies of citizens. The general parliament included all citizens but rarely convened except to affirm a major decision. In 1288, it had between 6,000 and 12,000 men (these figures were cited by opposing sides in a lawsuit and therefore presumably represent the extremes). The general and special councils were groups of elected citizens. The general council was larger and was for the most part advisory; the special council, consisting of twenty-six to forty-eight men, had fairly extensive legislative powers.

From at least the mid-twelfth century on, Viterbesi documents mention the existence of a *popolo* as a part of the power structure of the city. At that point its institutional status is uncertain, but in the

thirteenth century it appears clearly distinguished from the commune and in greater detail. The *popolo* was organized by *artes* (guilds), and its leader was initially the *bailivus* of the *artes*, elected by the leaders of the guilds to participate in running the city. In 1254, the *bailivus* was replaced by the captain of the people, an office usually held by a member of one of Viterbo's noble families.

In the 1280s, the *popolo* led rebellions against some of Viterbo's aristocrats, instituting governments led entirely (aside from the *podestà* appointed by the pope) by popular *anziani* or rectors of the guilds. The *Otto del Popolo* survived through the end of the Middle Ages, though its period of greatest power was from its foundation in 1292 through c. 1312. In the early fourteenth century, Viterbo's government was dominated by a single noble, a *signore*, first from the Gatti family, then from the Di Vico. This dominance by a *signore* continued through the fourteenth century; it was only temporarily interrupted by Cardinal Albornoz's conquest of the papal state in mid-century.

Political History

Some of Viterbo's earliest surviving documents record the young commune's acquisition of territories in its vicinity. The city continued to expand its control over the region throughout the thirteenth century, until its *contado* (countryside) became a mosaic of dependent, allied, and independent sites extending from Aquapendente in the north to Sutri in the south, and from the Tiber to the sea. The growth of Viterbo's sphere of influence brought the city into conflict with Rome, which was at that time much closer in size to Viterbo than it is now. Viterbo also was frequently tangled in papal and imperial politics, owing to its size and strategic location. The large-scale conflict between the papacy and the empire had local ramifications, for various reasons—because one of the principals was actually present, or because local forces were marshalling themselves to fight in the ranks of one side or the other, or because factions within the city used the pope or the emperor as a rallying point and became his allies. Viterbo was most frequently an ally of the pope. The city's patron saint, Rose, was celebrated for her vocal opposition to a short period of Ghibelline (pro-

imperial) rule under Emperor Frederick II; and her opposition was considered all the more saintly because Ghibellines allegedly had ties to heretics. (This reasoning seemed easy when supporting the emperor meant challenging the pope.)

After Frederick's death in 1250, Pope Innocent IV reconciled Viterbo's Guelf and Ghibelline factions, and the subsequent history of the city, however acrimonious, shows no reversion to those earlier divisions. The pacification was marked by the codification of Viterbo's statutes of 1251 — 1252, which are an important source for Viterbese history. The popes were frequent residents through the later thirteenth century, importing European political conflicts into the city. Such conflict was particularly evident during two conclaves held in Viterbo. The more famous of the two is the Long Conclave of 1269—1271, during which the Viterbesi—who were irritated, like the rest of Europe, by the cardinals' inability to come to an agreement on a new pope—took the roof off the hall in which the conclave was being held and threatened to give the cardinals only bread and water and no toilets until they elected a pope. In 1281, local people and the Angevins were both hostile to the Orsini, who were represented by three cardinals; consequently, the *podestà* led a violent eruption into the conclave and the Orsini cardinals were kidnaped. Viterbo's conflict with the Orsini resulted in the removal of the city's privilege of electing its own *podestà*.

By the end of the thirteenth century, papal authority in the region was, if not fully effective, a force that Viterbo always had to take into account. With the removal of the papacy to Avignon, that authority diminished, until Cardinal Albornoz arrived to reinforce it. From 1305 until the 1350s, political decisions in Viterbo were made by its *signori*, who led the city into constant wars with other cities in the region. This warfare resumed not long after Albornoz's reorganization, this time exacerbated by another factional division in Viterbo—that between the Gatti and the Mangonesi families.

Economic Life

Viterbo's economy was largely agricultural: olives, wine grapes, grains, pigs, sheep, and chestnuts from the mountains. The statutes and many

agreements with dependent towns (*castri*) are concerned with raising and selling produce, especially grains. Viterbo insisted, when it could, that grain from its *contado* would be sold in the city, so that it would receive the tolls and taxes from the sales.

Linen was a regional specialty, and medieval Viterbo was the center of a thriving industry. Because linen processing creates pollution, this industry had to be extensively regulated, particularly to ensure an uncontaminated supply of water. Overall, Viterbo's water statutes are well developed and thorough, showing that the administration of the water supply was very important and that the commune could claim a great deal of authority in the provision of such a basic necessity.

Viterbo was not a major mercantile or banking center. Though some Viterbesi entered into long-distance trade, most seem to have focused on local exchange. The most important of Viterbo's guilds, judging from the surviving documents, was that of the judges and notaries. Other guilds were formed for trades such as builders, butchers, millers, shoemakers, and innkeepers.

The innkeepers must have been important, for Viterbo's economy was boosted by the streams of pilgrims traveling to and from Rome, and by the frequent presence of the curia. The impact of the curia led (by agreement between the city's *podestà* and the cardinals) to a doubling of the normal rents and food prices that were higher than usual, though not unlimited. The vast throng of curial servants such as cooks and grooms, and the accompanying swarm of petitioners and others who had business in the curia, must have filled Viterbo's lodgings and substantially affected the city's economy.

Art, Architecture, and Literature

Viterbo's Lombard period is represented most purely by the cloister of Santa Maria Nuova; it is also manifest in Lombard-style architectural details such as the external staircases on many medieval houses. Many of Viterbo's churches are Romanesque or have been restored to the Romanesque—the destruction that took place during World War II has enabled restorers to rebuild some churches in their original style, removing the Baroque remodeling that most of them had acquired. The

cathedral of San Lorenzo and Santa Maria Nuova both represent Viterbese Romanesque, as does San Sisto, which also preserves some of its Romanesque bell towers. San Lorenzo and Santa Maria Nuova retain some of their medieval frescoes. San Lorenzo's other interesting medieval features are its Cosmatesque paving and a Siennese-style striped bell tower.

The papal palace, on the same *piazza* as San Lorenzo, was built for the most part in the late 1260s. It is the largest surviving thirteenth-century papal palace, consisting of a large meeting hall, curial offices, storage areas, and private quarters organized in a sequence that generally recalled the Lateran in Rome. It is approached by a large stairway and is flanked by a loggia built by the Gatti family in the 1270s; this loggia has lovely Gothic tracery, an early instance of the style in this part of Italy.

San Francesco, the Franciscan church, was heavily bombed in World War II, but has been restored to an approximation of its original Gothic. It contains two interesting marble-and-mosaic papal tombs: one of these, the tomb of Adrian V, is believed to be by Arnolfo di Cambio; the other is believed to be by an artist working under Arnolfo's influence. Gothic influences are also apparent on facades of several palaces that had belonged to noble Viterbesi families: the Gatti, the Alessandri, and the Chigi.

Viterbo's two most important medieval writers were Godfrey of Viterbo (c. 1125-c. 1202) and James of Viterbo. Godfrey wrote the *Pantheon*, an encyclopedia of theological ideas and history in verse that was drawn on by medieval historians such as Ptolemy of Lucca and Sicard of Cremona. James was a political theorist who wrote on papal and worldly power; he wrote *De regimine christiano* between 1301 and 1303 in support of Pope Boniface VIII.

Viticulture

Paul the Deacon, writing his *History of the Lombards* in the late eighth century, thought highly enough of the wine of Italy to suggest that it caused an invasion: "The reason the Gauls came to Italy is represented to have been this: when they tasted the wine brought from this country, they were enticed by greed for this wine and passed over into Italy." Long before this, the Greeks had named the peninsula Oenotria, the "land of wine"; and in the Roman world Italy was famous for both the quality and the quantity of its vintages. There can be little doubt that

Roman viticulture in Italy was wildly successful, as huge quantities of wine were produced and sent all over the Mediterranean. This commerce, which reached a peak in the late empire, was not restricted to higher-quality wines (such as those of Campania); ordinary wine of no particular quality also found its way out of Italy.

In medieval Italy, viticulture was based on Roman skills such as those recorded by the agronomist Columella, who devoted two whole books of his treatise *On Agriculture* to the cultivation of vines. Viticulture was, and remains, a manual task, and a very specialized and labor-intensive one at that. The size of the crop and the taste of the wine in the first instance depended on care by the farmer during the long time (about five years) before the vines reached maturity. Although it is certain that wine production remained important in the medieval period, no literary discussion of it survives until that of the Bolognese agronomist Piero de Crescenzi, c. 1320. Columella's work was copied in the ninth century (although not in Italy), so Roman viticultural skill was not lost, despite the supposed disasters of the sixth and seventh centuries. From the eighth century on, charter texts record vines all over the Italian landscape, on great estates and tiny peasant plots alike, where they were treated with particular care in enclosed fields (*clausurae*). The Lombard law codes of Rotharius (c. 643) and Liutprand (early eighth century) imposed fines on those who damaged individual vine plants. Such cossetting was the medieval norm; not until later, c. 1300, does the promiscuous cultivation of vines seem to have become especially common.

As the Christian churches began to make more of an impact on the Italian landscape in the eighth and ninth centuries, new uses of wine began to develop. Churchmen were involved with wine not simply as a drink (although Saint Benedict made specific provision in his monastic rule of c. 540 for the monks to drink it), but also in medicine and especially in the liturgy. This interest was reflected in ordinary agrarian contracts between community and peasant in which vines frequently appeared; it was also reflected in documents in which abbots arranged for new vineyards to be planted on monastic lands. The expansion of a vineyard area was reckoned as a noteworthy achievement, as can be seen from the funeral inscription of Peter, abbot of the monastery of Sant'Ambrogio in Milan, who died in 900 and was remembered because

"he built temples, palaces, vineyards, olive-groves, and orchards; he augmented the treasury; and he doubled the lands of the monastery."

Most of the evidence for earlier medieval viticulture in Italy comes from the north—especially from the Po valley, where there seems to have been a lively commerce in wine all along the river. By contrast, much less is known about the great regions of Roman wine growing, Campania, Lazio, and Umbria; and it is unlikely that wine production there continued at Roman levels. Certainly, there is very little evidence that Italian wine was exported beyond Italy between 700 and 1100 on anything like the Roman scale. From c. 1100 on, the great maritime towns of Venice, Genoa, Pisa, and Amalfi do seem to have been trading in high-quality wine, a trend that continued for the rest of the Middle Ages. At this time, demand for wines of quality also began to increase within Italy, especially in the cities that had been the great wine consumers of the Roman world. From c. 1000 on there is evidence that vines were actually being grown in cities (two cases which have been investigated are Bologna and Rimini), possibly to meet an increased demand. It is not clear if this had also been a Roman practice. Tastes began to change, too. Romans, especially the elite, had always drunk wines such as Falernum and Albanum. Medieval Italians preferred younger wine, normally the most recent vintage. New varieties were developed, and wine came to be made from a quite amazing variety of grapes. Even today, Italy preserves by far the largest number of grape varieties of any country, and some of its commonest types (*trebbiano*, *vernaccia*, and *schiaiva*) are medieval, not Roman, in origin.

Volgarizzamenti

Properly, the term *volgarizzamenti* refers only to translations from Latin into the vernacular (the *volgare*) until the Renaissance. However, we need to take a much broader view and consider all Italian texts modeled on Latin or French originals until Boccaccio. There are at least three reasons why this is necessary: first, our notion of translation is a humanistic concept; second, there are many different ways of transposing a text (abbreviating, lengthening, rewriting, compiling, contaminating); third, we must take into account the role played by *volgarizzamenti* from French in the divulging of classical texts.

The *volgarizzamenti* reflect a new mode of thought for Italian writers, who were eager to escape the restrictions imposed on them by a closed notion of genres with their corresponding styles. They are interesting because they reflect not only the availability and popularity of texts, but also the changing tastes of a growing audience of middle-class and relatively uneducated readers. Viewed together with other documents from early Italian literature, the *volgarizzamenti* reveal an attempt to create a new literary prose.

Among the models chosen for such an enterprise, the French literature of the *langue d'oïl* was the most easily adapted to Italian: many *volgarizzamenti* show only phonetic changes from the original and a plethora of words copied verbatim; many texts became Italian only gradually. The literature of the *langue d'oc*, mostly in poetry, was widely read and available in Italy (for instance, at the Sicilian court of Frederick II), but it appealed to an aristocratic audience that had little need for Italian versions; very few *volgarizzamenti* from Provençal have come down to us. The frequent and growing commercial relations between Italy and France; the availability and popularity of many French works known in Italy in the original (many French codices which have come down to us from the thirteenth century were written in Italy); and the presence of oral traditions of mixed-language epics in northeastern Italy are all factors in the wide distribution and popularity of the *volgarizzamenti* in Italy.

Although we can surmise that most or the early *volgarizzamenti* from French have disappeared, we can measure the interests of the audience through the number of surviving manuscripts. Virtually all of these are anonymously translated. They reflect the more popular levels of culture; the number of codices is generally inversely proportional to

the length of a text. But it would be wrong to underestimate the influence of these works: in some cases, for instance, a *volgarizzamento* has no surviving antecedent; in others, miscellaneous codices contain otherwise unknown parts of texts of great documentary and linguistic interest.

Only a brief summary of the most representative *volgarizzamenti* is possible here. The Arthurian and Breton legends (*Tristano riccardiano* and *Tavola ritonda*), praised by Dante, constitute remarkable examples of a timeless, magical, dreamlike prose denuded of all but the most symbolic referents (trees, fountains, castles, woods). Narrative works (*Conti morali* by the Anonimo Senese, from the *Vies des anciens peres*; the very popular *Libra dei sette savi*, deriving from a French prose original) show a quest for a literary language modeled on the immediacy and power of the spoken word. Translations of didactic works such as Richard de Fournival's *Bestiare d'amours* and the French version of Egidio Colonna's *De regimine principum* were popular and influential. Books written by Italian authors in French (Brunetto Latini's *Tresor* and Marco Polo's *Divisament don monde*) were translated very soon; many scientific works came through French translations of Latin and Arab works (Zuccherò Bencivenni's fine Italian translation of Aldobrandino da Siena's *Régime di corps* dates from 1310).

The classical heritage exerted a very strong pull on the middleclass audience, especially as the *comuni* developed and sought legitimation in knowledge of the past. Six versions of the popular French text *Li fet des romains* (dated 1213-1214; first translated c. 1260) have survived, in more than sixty manuscripts; Benoit de Sainte-Maure's *Roman de Troie* was adapted in a number of works (among which is the *Conti di antichi cavalieri*). The growing interest in history is brilliantly represented by the first translation of Livy in Italy, the *First Decade*, made in 1323, already a sign of a changing cultural climate; the language is effective, and the orations are noble and powerful.

With *volgarizzamenti* from Latin, Italian literature begins to show real signs of the vitality that will lead to humanism. Latin literature provided prestigious models and an abundance of materials that gave an impetus to ever-greater experimentation in genres and styles. We can follow a progression from short and still largely fictionalized texts (*Fiori e vita di filosafi*, *Disciplina clericalis*) toward more ambitious

projects, such as the *Storie de Troia* and the *Miracole de Roma*. Perhaps the central classical author to be translated is Cicero; he is widely present in the romance tradition as a knight or a cleric, and he becomes the master of rhetoric, which gradually took over the old system of knowledge based on the *artes*. Thus Guidotto da Bologna's *Fiore di retorica* (a translation of the pseudo-Ciceronian *Rhetorica ad herennium*) is quickly followed by Brunetto Latini's *Rettorica* (a partial version of *De inventione*, written in France shortly after 1260) and perhaps even more significantly by the three orations (*Pro Ligario*, *Pro rege Deiotaro*, *Pro Marcello*), which were meant to provide models of eloquence for the political world of the communes. Brunetto started to disseminate an idea of the cultured man as one who knows how to express himself. Vocabulary expands greatly with pedagogic works (the scholastic *Disticha catonis*) and scientific texts (notable in this respect is Pier de' Crescenzi's voluminous *Trattato di agricoltura*, written c. 1310), among which medical works attributed to Zuccherò Bencivenni figure prominently. Pious literature represents another tendency and another quest for expression which yielded interesting results in Domenico Cavalca (*Vite di Santi Padri*, *Dialogo di San Gregorio*) and in the *volgarizzamenti* of Albertano da Brescia; the anonymous translation of the *Legenda aurea* is essential reading for understanding the origins of Boccaccio's *Decameron*.

The great role played by Bono Giamboni in the development of *volgare* can be measured by comparing his original work (*il libro de' vizi e delle virtudi*) with his translations from Latin, notably Orosius and Vegetius; although no translation of his from French can be identified with certainty, he is perhaps the most widely attributed translator of the *Duecento*. Around 1310, Bartolomeo da San Concordio's translations of Sallust reveal an author preoccupied with reproducing the concise and powerful style of his original, where the quality of the expression is designed to match the content of the narrative. From here the road to humanism is visible: when we read the translation of Valerius Maximus, it is easy to breathe a new air of respect for the source and its language (*res publico*, is *repubblica*, not *comune*; *legatus* is *legato*, not *ambasciatore*). The figure of Livy casts a gigantic shadow over the cultural landscape when the *Third Decade* and *Fourth Decade* are translated (from Petrarch's emended text),

perhaps by Boccaccio himself, in the mid-fourteenth century; one can find in this work the full balanced sentence, the harmony of the syntactic elements, and the power of expression of a mature literature.

A final word about *volgarizzamenti* of poetry: if prose is truly the bearer of the great novelty represented by the *volgarizzamenti*, then the translations of poetry represent a more specific quest for the expressiveness of the single word; medieval translators experimented with Virgil (1320-1340), Boethius (1330), and especially Ovid (*Remedia amoris*, *Heroides*, and *Metamorphoses*). Recent years have seen a revival of scholarly interest in the *volgarizzamenti*, and a number of much-improved editions, but a great deal of work remains to be done to give us a clearer view of the role played by the *volgarizzamenti* in the development of a consciousness of the unique Italian literary experience.

Volterra

Volterra, in Tuscany, was founded on a Villanovian site and was an ancient Etruscan city (Velathri), the northernmost of the twelve cities in the Etruscan confederation. In the third century B.C. it entered into an alliance with Rome, becoming the Roman *municipium* Volaterrae. It retained local rights and liberties and enjoyed considerable prosperity down to the period of the social wars. Then, because of its support of the Marian faction, it was besieged and punished by the supporters of Sulla, who reduced it to a military colony. In this diminished state, it passed through the Roman imperial period.

Palazzo dei Priori, Volterra. Photograph courtesy of Christopher Kleinhenz.

By the fifth century, it was an episcopal city and a place of refuge for Catholic Christians who were being persecuted by the Vandals of North Africa. Successively, under the Lombards and Franks, it was the residence of a count; but over time the bishops became the true rulers of the city. Their jurisdiction and powers were confirmed successively by emperors Henry III (1052), Frederick I Barbarossa (1164, 1185), and Henry VI Hohenstaufen (1189, 1194). From 1150 to 1239 the powerful office of bishop became a hereditary monopoly of the Pannocchieschi family. As early as 1150, however, a commune had begun to emerge in

the city under its own consuls and eventually (1193) a *podestà*, challenging episcopal authority.

In the course of the thirteenth century, the commune achieved dominance in the city, subjecting powerful feudal nobles in the countryside. However, factional struggles between Guelfs and Ghibellines prompted a brief ascendancy of the supporters of Frederick II in 1245-1250. By the *constitutum* of 1252, provision was made for a *podestà*, a *capitano*, and twelve *anziani* (elders). Nevertheless, continued internal strife made Volterra vulnerable to interventions by the neighboring cities of Florence, Siena, and Pisa. Episodes of revived episcopal leadership alternated with renewed struggles between Guelfs and Ghibellines. Experiments with seigniorial regimes were climaxed by those of Ottaviano Belforti (1340), alternating with those of the duke of Athens (Walter of Brienne, 1342-1343) and his sons (1348). Finally, in 1361, the Florentines seized the city's fortress, imposed their own *capitano*, and excluded all native citizens from political offices. Volterra thus became a part of Florence's progressive absorption of all of Tuscany. Subsequent Florentine rule of the city did not pass, however, without recurrent episodes of rebellion.

Volterra preserves a rich assortment of material survivals from all phases of its history. The massive Etruscan walls are an outstanding example of their kind. The museum (Museo Etrusco Guarnacci) houses one of the finest collections of Etruscan antiquities in Italy. From the Roman period, a splendid theater and adjacent baths have been excavated. The historic center preserves numerous medieval monuments, among which are many ordinary houses and towers of the period. The Palazzo dei Priori (1208-1254) is perhaps the archetypical civic palace in Tuscany. Across the square from it is the Palazzo Pretorio, which, combining various structures of the thirteenth century together with the Torre del Porcellino (or del Podestà), served as the residence of the *capitano del popolo*. The *duomo*, begun in the twelfth century in the Romanesque style, was rebuilt in the Pisan style in the thirteenth century and later underwent extensive internal changes; it houses a celebrated Deposition group by a Pisan sculptor in polychrome woodcarving (1228). The octagonal baptistery with alternating horizontal bands of black and white marble has sculptured heads of Christ, Mary, and the apostles on the architrave over the doorway

(dated 1283). The city's medieval heritage is conveyed not merely by individual buildings but by its character and atmosphere.

Waldensians

The Waldensians, also called the Poor of Lyon, were a heretical sect founded by the merchant Valdes and were probably the largest medieval heterodox group.

Valdes was a wealthy merchant and usurer of Lyon who experienced a powerful conversion c. 1173. While listening to a jongleur sing of Saint Alexis, an early Christian who had turned away from great wealth to take up a life of poverty and penance, Valdes was suddenly seized by remorse for his own sins and by a realization that his wealth was a hindrance to his salvation. He had discussions with a theologian and contemplated biblical and patristic texts that he had hired priests to translate; all this convinced him that he should pursue the evangelical life of preaching and poverty embraced by the apostles and the early church. After providing for his wife and daughters, Valdes distributed his money to the poor and began to preach and beg in the environs of Lyon. He soon attracted a following who also went about preaching repentance; they called themselves "the poor."

These activities brought Valdes and his followers into conflict with the clergy of Lyon: they were violating church laws that forbade laymen to preach without the permission of the clergy, and they seemed to be usurping the authority of the city's churchmen. Moreover, their emphasis on apostolic poverty was causing laypeople to criticize wealthy clerics. Within a short time, the archbishop forbade the Waldensians to preach. Valdes at first ignored the archbishop's order but then decided to seek approval from Pope Alexander III. In 1179, he appealed to the pope at the Third Lateran Council. Alexander's decision did not resolve the situation, however: he approved the Waldensians' vow of poverty but prohibited them from preaching without the approval of the local clergy.

From this point on, relations between the Waldensians and the clergy

of Lyon worsened. The clergy came to fear that Valdes's followers would be influenced by the heretical teachings of the Cathars; also, zealots claiming an affiliation with Valdes's group created more friction. New attempts by the archbishop to silence the Waldensians brought a staunch refusal from Valdes, who reportedly quoted Saint Peter; "It is better to obey God than men" (Acts 5:29). In 1182, a new archbishop promptly excommunicated the group and drove them from his archdiocese. They quickly spread through southern France and northern Italy, winning many followers. Pope Lucius III condemned them in 1184, but their numbers continued to grow. By the turn of the thirteenth century, Valdes's followers had become well established in France and Italy and were beginning to appear in Germany.

The Waldensians' belief centered on a determination to follow all the commands and precepts given by Christ to his disciples, even those traditionally reserved to the clergy. When clergymen objected, the Waldensians accused them of contradicting scripture and rejected their authority. Some Waldensians, including Valdes, hoped for a reconciliation with the church. Others contended that the Roman church had lost its authority when it embraced wealth in the time of Constantine, and that Waldensians were called by God to reconstitute the apostolic life which the Roman church had abandoned. They developed a "remnant theology"—an image of a few faithful Christians preserving the true faith of the apostles in secret during the centuries between Constantine and Valdes. In place of the Roman clergy, they created their own lay ministry, the "perfect," pious men and women who renounced possessions and marriage to attend to the faithful. Their function was to hear confessions, celebrate the eucharist, preside at baptisms and weddings, and above all preach to the faithful and evangelize among unbelievers. On scriptural grounds, Waldensians rejected Purgatory, indulgences, and the cult of the saints, and they declared legal proceedings, oaths, capital punishment, and warfare to be sinful.

Valdes probably died during the first decade of the thirteenth century. Even before his death, serious tension had developed among his followers; the French and Italian branches of the Waldensians formally split in 1205. This had little effect on the sect's growth, however, because the Waldensians ecclesiastical organization was so

loose. The attempts of the Roman church to combat the spread of Waldensian beliefs also had little impact until the emergence of the papal Inquisition in the 1230s. Then, however, the church made rapid gains. Although the Inquisition was aimed against Cathars in particular, it often caught Waldensians as well. By the end of the thirteenth century, Waldensians had been driven out of most urban centers. They remained active in remote areas up to the Reformation, when many of them joined Protestant denominations. The Waldensians of the Piedmont survived into modern times and were granted equality with Catholics in 1848.

Walter VI of Brienne (d. 1356) was the son of Jeanne de Chatillon and Walter V (d. 1311), count of Brienne and duke of Athens. Walter VI was unable to hold the duchy of Athens after his father's death; he continued to claim the title but fled to the Angevin court at Naples. There he reached maturity and worked in the service of King Robert. Throughout his life, Walter continued, unsuccessfully, to press his claims to the duchy of Athens while accepting numerous signorial and military appointments.

Walter is best-known for his involvement with Florence. In 1325, he served the city for two and a half months. Later, in 1342, the Florentines commissioned him to command their forces, then fighting Pisa for possession of Lucca. Walter accepted and was soon proclaimed *signore* of Florence for life. He was initially championed by the politically dominant patricians, who hoped that he would preserve their power against pressures from a politically weakened nobility and a disenfranchised working class. The nobility implored Walter to repeal the Ordinances of Justice of 1293, which restricted their political activity. Walter did allow the ordinances to fall into abeyance, but he did not repeal them, and he soon lost his support among the nobility. He tried to broaden his support by cultivating lesser Florentine guildsmen and laborers, but in the end he also failed to please them. On Saint Anne's day, 26 July 1343, the Florentines revolted against him. After his expulsion, Saint Anne's day was declared a public holiday.

Walter died fighting against the English at Poitiers.

Weights and Measures

Medieval Italy had more systems of weights and measures and more individual units than any other country in western Europe except the Holy Roman empire. The major reason was that Italian metrology developed without any reference to a commonly accepted set of national standards. In England, the Winchester standards and later the London standards served as prototypes for bringing thousands of local units into eventual alignment. In France, the weights and measures of Paris occupied this position. But Italy, with its many kingdoms, duchies, communes, republics, and the like, was never able to attain any level of metrological standardization outside the confines of severely restricted, small, independent political jurisdictions. Generally, not until the mid-nineteenth century—and as a practical matter not until unification was achieved in 1871—were Italian weights and measures given a totally uniform national character. Then, it was the metric system, not a conglomerate of units rehabilitated from the past, that finally accomplished the task.

General Characteristics

Although no precise boundary can be drawn, weights and measures in medieval Italy tended to be divided into a northern and a southern system. The northern system extended from the famous urban centers of Tuscany to central Italy; the southern system included all of southern Italy and the islands of Malta, Corsica, Sardinia, and Sicily. Within these two zones, all weights and measures had either local, regional, or interregional applications. Local units (*comune*, *comunitativo*, *da piazza*, or *di città*) used in urban and rural settings dominated Italian metrology. There were several hundred thousand such units, and they rarely had any use outside their immediate environs. Approximately

100 regional units (*delict commissione* or *legale*) were found in the two major systems. Although they rarely crossed the lines of demarcation between north and south, they did provide a modicum of standardization within their respective zones. It was the interregional units that enabled Italy to have at least a semblance of a national system. They were the backbone behind the commercial revolution after c. 1000.

To further complicate matters, among all these weights and measures there were thousands of special units—agricultural (*agrimensorio* or *da terra*); architectural (*architettonica*); scientific (*geometrico*); medical, pharmaceutical, and commercial (*commercio* or *mercantile*); manufacturing (*da fabbrica*); industrial and trade (*da muratore* or *manuale*); forest (*da foreste*); maritime (*della marina*, *geografico*, or *marittimo*); textile (*da cotone*, *da lana*, *da panno*, *da seta*, *da tela*, *da tessitore*, or *della stoffe*); horticultural (*da frantoio*); viticultural (*da vigne*); fishing (*dapesci*), and business—and these bore no relationship to one another either in application or in inter- and intraunit proportions. Hundreds of other units were used specifically for taxes (*censuario*), precious gems, gold, silver, and scale weighings (*da bilancia* or *da stadera*). There were special product and quantity units (for example, *balla*, *ballone*, *bariglione*, *dozina*, and *tonnellata*); there were many units that had multiple names and usages (for example, *cantaio*, *carara*, *carica*, *carrata*, *centinaio*, *coppo*, *decimo*, *decina*, *grannotto*, *grosso*, *lira*, *migliaio*, *mina*, *misura*, *ottavo*, *passetto*, *peso*, *quarta*, *rubbio*, *salma*, *spazzo*, *staiolo*, *staro*, *tavola*, *trappeso*, and *vignale*); and there were numerous diminutives (for example, *baletta*, *bariletto*, *brentina*, *centesimo*, *decimillesimo*, *granottino*, *millesimo*, *quartarella*, and *sedicesimo*) that had no definite sizes or dimensions.

This chaotic state of affairs certainly was a radical departure from the uniform, integrated, and standardized system of weights and measures that Italy had enjoyed from the later centuries of the Roman republic to the declining years of the Roman empire. Roman weights and measures had been the "metric system" of the ancient world. But Italy suffered the same fate as the rest of western Europe when the Roman empire collapsed in the wake of the barbarian invasions after the fourth century. Centralized governments fell, and the cohesive forces of a standard language, law, military structure, coinage system, and weights

and measures vanished from the Mediterranean world. Out of the ashes rose the native metrological systems of Europe. Italy was part of this new order.

Interregional Standards

Despite these grave problems, Italy's interregional standards were used extensively at home and abroad, and they constituted the metrological basis of most important financial and commercial transactions. Following are the principal weights and measures of medieval Italy. Unless otherwise noted, the various weights and measures were used throughout Italy, Sicily, Sardinia, Corsica, and Malta. Since so many different standards served as prototypes, the metric equivalents are given only as ranges over which they fluctuated (U.S. equivalents, though not stated, are calculable from the metric values).

Linear measurements. For linear measurement, there were seven major units. The *braccio* ("arm") was the premier industrial and mercantile measure of length, found primarily in northern and central Italy. It was defined originally, in the early Middle Ages, as the length of the two arms extended when measured from the tips of the middle fingers and was reckoned generally between 5 and 6 *piedi* ("feet"), but each *piede*, usually of 12 *once* ("inches"), varied from 0.223 to 0.649 meter; thus the *braccio* could range from 1.115 to 3.894 meters.

The *canna* was the principal unit for textiles, agricultural land divisions, construction, architecture, and forestry. It was usually divided into a diverse number of *braccia*, *palmi* ("palms"), *piedu* or *once* (approximately 0.996 to 7.851 meters); it was sometimes used synonymously with the *pertica* ("perch," "rod," or "pole") or *trabucco*.

Among the smaller linear units were the *punto* ("point"), *piede*, and *palmo*. The *punto* consisted of 12 *atomi* (about 0.00143 to 0.005846 meter) and equaled 1/12 *uncia*. The *piede* consisted generally of 12 *once* (about 0.223 to 0.649 meter), but there were numerous variants ranging from 6 5/6 to 32 4/5 *once*. The *palmo* also consisted of 12 *once* (about 0.1250 to 0.2918 meter), but it had no established set of submultiples.

The largest interregional standard was the *miglio* ("mile"). This was originally based on the Roman mile of 8 *stadii* (furlongs) of 1,000

geometrical paces totaling 5,000 feet (about 1.481 kilometers). However, by the later Middle Ages, a number of important regional standards gained dominance. The *miglio* was generally divided into an irregular assortment of *corde* ("cords"), *canne*, *palmi*, *passi* ("paces"), *perticbe*, *braccia*, *trabucchi*, *orpiedi*, and it varied from about 1.482 to 2.519 kilometers.

Measurements of capacity. Capacity involved the greatest number of interregional standards because of its obvious importance to national and international trade. The *barile* ("barrel") was the major measure for liquids and dry products. This unit was borrowed from the French during the High Middle Ages. It was divided regionally into an irregular number of *rotoli*, *caraffe*, *fogliette*, *pinte* ("pints"), *cannate*, *quartucci*, *misure* ("measures"), *some*, *zucche*, *ambole*, *boccali*, *quarte* ("quarts"), *fiaschi* ("flasks"), *amole*, *rubbi*, *quarteroni*, *quartare*, *libbre* ("pounds"), *libbrette* ("light pounds"), or *secchie* varying in size from about 0.117 to 2.248 hectoliters. For wine, the *boccale* was the most important measure throughout Corsica and northern and central Italy; it varied from about 0.041 to 3.044 liters and was divided into *once*, *quarte*, *mezzi*, *terzetti*, *fogliette*, *rotoli*, *zaine*, *quartini*, *mezzette*, or *quartucci*. In northern and north-central Italy, the *brenta*, usually divided into *boccali*, was the major unit for wine; it varied from about 0.475 to 1.233 hectoliters. In central and southern Italy, the *caraffa* was the major unit for wine; it was calculated in weight content by *once* (about 0.322 to 6.341 liters). The *pinta* mentioned in all these units normally consisted of 2 *boccali* and varied in size from about 0.893 to 2.262 liters.

For grain and other dry products the *moggio*, *quartaro*, *quartarolo*, *quartuccio*, *soma*, and *staio* were paramount. Although these measures could all be applied to liquids and were used occasionally to determine surface or volume specifications, their principal use was for selling or bulk-rating agricultural produce. The *moggio* varied from about 1.393 to 6.633 hectoliters and was usually divided into *sacche* ("sacks"), *staia*, *quarte*, *quartini*, or *scodelle*. The *quartaro*, normally consisting of 4 *meta*, varied from about 0.046 to 0.220 hectoliter. The *quartarolo* and *quartuccio* were divided into a wide variety of local measures; the *quartarolo* varied from about 0.581 to 36.807 liters, and the *quartuccio* from about 0.355 to 6.135 liters. The *soma* was generally divided into

tomoli, quartari, staia, emine, or sacche and varied from about 1.456 to 2.112 hectoliters. The *staio*, normally divided into *mine* or *quarte*, varied from about 0.091 to 2.945 hectoliters.

Measurements of area. In medieval Italy, agricultural land areas were measured using *the giornata* more than any other superficial (surface) unit. Originally the *giornata* was the amount of land covered by a man and draft animal in the course of one workday (the English acre). During the High Middle Ages and the late Middle Ages, it had regional variations ranging from about 0.090 to 0.450 hectare and was usually reckoned in square *passi, palmi, tavole, staia, or canne*.

Measurements of weight. For weights, there were nine principal standards. The largest was the *cantaro*, a hundredweight for bulk rating wholesale shipments of goods carried long distances overland or by sea to foreign markets, especially to the hundreds of *fondacos* or factories established by Venice, Genoa, and other Italian cities in foreign urban centers along the Palestinian and North African coastlines. It varied generally from 100 to 250 *libbre* (about 30.12 to 339.29 kilograms), its exact weight depending on the various local standards for the *libbra*. The *carato* ("carat") was the smallest. A weight of 4 *grani* ("grains"), it was used for gold, silver, and precious gems, and it varied from about 1.770 to 2.135 decigrams.

In between these two extremes were the *denaro*, a weight of 24 *grani* (about 1.075 to 2.432 grams), generally synonymous in name with the *dramma* ("dram") and in size with the *scrupolo* ("scruple"). The *dramma* was a weight of 72 *grani* (about 1.671 to 3.595 grams), generally consisting of 3 *denari* or *scrupoli* equal to 1/8 *uncia*. The *scrupolo* was a weight of 24 *grani* (about 0.891 to 1.198 grams) equal generally to 1/3 *dramma* or 1/24 *uncia*. The *rotolo* was generally considered equal to 1/100 *cantaro* (about 0.475 to 1.019 kilograms).

The standards on which the above weights were based were the *grano*, *uncia*, and *libbra*. The *grano* consisted of 24 *granottini* or *granotti* ("light grains," about 0.000045 to 0.000055 kilogram) and equaled 1/24 *denaro*. The *uncia* generally equaled 1/12 *libbra* (about 0.0245 to 0.0431 kilogram). The *libbra* was the foundation stone for every weight system. Most cities had two *libbre*—a light (*piccolo* or *sottile*) and a heavy (*grosso*). Both *libbre* were often used interchangeably with the *lira* (pound). Each *libbra* normally consisted

of 12 *once* (about 0.239 to 0.980 kilogram), but intraunit proportions of 8, 13 7/8, 14, 15, 16, 18, 24, 28, 30, 32, and 36 *once* were not uncommon.

Most European countries that did not have an axis around which to formulate a national system of weights and measures eventually opted for metric uniformity during the nineteenth century. Italy was no exemption. But during the Middle Ages, despite the formidable obstacles presented to business and financial operations by the metrological vagaries described above, Italy created and sustained the medieval world's greatest commercial empire. That perhaps is the ultimate testimony to the applicability and adaptability of these metrological units to the Italian mercantile machine.

Wiligelmus

Wiligelmus (Guglielmo, Wiligelmo; fl. c. 1099–c. 1120) is often considered the first great Italian sculptor. His reliefs on the facade of Modena cathedral are among the first important sculptural programs of northern Italy, as part of the early development of Romanesque sculpture. His identity as the creator is known from an inscription held by the figures of the prophets Enoch and Elijah: *Inter scultores quanto sis dignis more—Claret scultura nunc Wiligelme tua* ("How much honor you deserve among sculptors is now shown by your sculpture, Wiligelmo"). Wiligelmus's oeuvre has been identified at Modena and elsewhere through stylistic comparisons with these prophets, carved from the same block as the inscription.

Wiligelmus's principal work is the sculptural assemblage on the west facade of the cathedral of Modena, presumably executed c. 1106-1110, including the inscription plaque; four reliefs from Genesis; two reliefs of *genii* with overturned torches; numerous capitals and decorative reliefs; and the program of the central portal, containing an elaborate scroll motif and twelve reliefs of prophets. The present placement of

some of the reliefs is the result of changes made to the facade in the late twelfth century by the Campionese masters, who added the lateral portals and relocated the first and fourth reliefs from Genesis above them. Some scholars hold that these reliefs were created as part of liturgical furnishings for the interior of the cathedral (Quintavalle 1964-1965), but the evidence suggests that they were originally intended as part of a sculptural program decorating the facade.

The four reliefs from Genesis flanking the central portal serve as a monumental introduction to the cathedral and constitute the first large-scale frieze devoted exclusively to biblical subjects. The general themes are the creation, the fall, and the promise of salvation as revealed in the flood. The frieze concludes with the ark as the ship of salvation—an Old Testament prefiguration of salvation and the mission of the church. *Labors of the Progenitors* and *Cain and Abel Offering to God*, which flank the main portal, present a lesson to the faithful about giving the fruits of one's labors to God (and the church). Textual similarities between the inscriptions and the liturgical drama *Ordo representationis Ade* suggest that performance and image were intended to work together to educate audiences about the roles of church and faithful in the history of salvation. Wiligelmus's Genesis frieze should thus be seen as an important early example of the development of large-scale didactic Romanesque sculptural programs.

Wiligelmus's figures are conceived as bold, massive, vital forms of great monumentality and plasticity. They convey an impressive sense of weight, as seen in the angels holding God's *mandorla* and Abel's slumping body in *Cain Killing Abel*. Figures emerge from the relief plane and fully occupy the space that is allotted to them, even bursting into the frame of the plaque (e.g., *Enoch and Elijah*). These forms have large heads, hands, and feet; broad faces with lead-inset eyes; hair articulated by long, wavy parallel strokes; and beards punctuated with drill holes. Solemn, full of *gravitas*, these bodies express the narrative action with clear, bold gestures. Wiligelmus animates his figures with palpable human expressions (especially notable is the anguish on Cain's face as he is killed by Lamech). Most of these sculptures make prominent use of inscriptions, either identifying figures or including more extensive biblical, liturgical, or secular texts; the inscription plaque held by Enoch and Elijah is an example.

Numerous sources and models for Wiligelmus's style have been suggested, including ivory, metalwork, and manuscripts as well as early Romanesque sculpture in Aquitaine and Bari. The most direct and most apparent source of inspiration is Roman sculpture. Local, provincial Roman works clearly provided models for several of the reliefs in Modena. The *genii* with overturned torches and the arrangement of the prophets Enoch and Elijah on the inscription plaque are clearly derived from Roman sarcophagi. Wiligelmus's access to these sources can be explained by *Relation translationis corporis sancti Geminiani* (*Account of the Translation of the Body of Saint Geminianus*), which mentions the miraculous discovery of a quarry of building materials, presumably the necropolis or other parts of the Roman city of Mutina (Modena). Wiligelmus adopted not only formal arrangements of figures from these Roman sources but also the sense of solidity and *gravitas* that distinguishes his sculptures. Furthermore, the obvious source of inspiration for the arrangement of the frieze around the central portal is the Roman triumphal arch. This suggests a certain conscious use of antique forms to connote both the venerable antiquity of Modena and the triumph of the church.

In addition to the program at Modena, Wiligelmus appears to have worked at the cathedral in Cremona before the earthquake of 1117. The four large prophets from the jamb of the portal are stylistically analogous to his work at Modena. Fragments of a frieze from the cathedral of Cremona, clearly modeled after Wiligelmus's reliefs in Modena, appear to have been executed by his workshop. Wiligelmus apparently directed a large workshop that trained numerous sculptors who continued his work at Modena and carried his style elsewhere. The two lateral portals at Modena—Porta della Pescheria (north, by the Master of the Artu) and Porta dei Principi (south, by the Master of San Geminiano)—are products of the school of Wiligelmus. These two portals follow Wiligelmus's basic scheme from the west portal, but with smaller, less massive, though more lively figures. The Porta dei Principi is the earliest example of the northern Italian form of a two-story porch-portal supported by lions or *atlantes* bearing columns. That this form developed in the context of Wiligelmus's workshop further indicates his seminal role in the development of northern Italian Romanesque sculpture.

Additional sculpture by the workshop of Wiligelrnus can be found at the Benedictine abbey of Nonantola, the cathedral of Piacenza, the Pieve di Quarantoli, and the Cluniac abbey of San Benedetto Polirole. The most noteworthy pupil of Wiligelrnus is Master Nicholas.

William, Duke of Apulia

William (r. 1111-1127) was the son of Roger Borsa and became duke of Apulia on Roger's death. The anarchy and disorder that had prevailed in southern Italy during the reign of his father became even worse during William's rule. Diminished and dismembered, the duchy was now a collection of independent regions. William died childless. The most direct heir was Bohe mond, the son of Bohemond I of Antioch (1058-1111); but Roger II of Sicily (1105—1154), William's cousin, was quick to assert his control over the area and annex it to Sicily. The papacy reacted promptly, organizing a coalition of southern Italian nobles to inhibit this union, but this response was not effective.

William I

William I (1120–May 1166, r. February 1154–1166) was the son of King Roger II of southern Italy and Sicily (whom he succeeded), and Albricia of Castile. Thanks in part to a prejudiced but influential account in a twelfth-century chronicle, *History of the Tyrants of Sicily*, by the so-called Hugo Falcandus, William I has often been referred to as "the Bad." Loud (1999) suggested that "the Unlucky" might be a more appropriate sobriquet, and Norwich (1970) offered "the Sad" as another possibility.

William I inherited the kingdom created by his celebrated father. This inheritance included a nobility discontented with the rapid changes in royal policy regarding the mainland. At least two rebellions occurred during William's reign, in 1155-1156 and 1161. A number of principal lords were exiled for their opposition and remained a significant threat. William's chief minister, Maio of Bari, aroused much consternation and was eventually overthrown and murdered by the rebels. William I also faced threats from foreign powers, especially from the Byzantines, against whom he battled in 1155. In 1158-1160, he lost the North African holdings that had been won by his father.

William I did not receive adulation—the sources reserve that for his father—but his reign was not a total disaster. Accounts of William's cruelty and paranoia notwithstanding, he did achieve some success in securing peace treaties with Venice, Genoa, the Byzantine empire, and the papacy.

William II

William II (1154-1189, r. 1166-1189) succeeded his father, William I, as king of southern Italy and Sicily. He was twelve when he assumed the throne, and until he reached his majority, his mother, Margaret of Navarre, served as regent. William II is frequently referred to as "William the Good"—in comparison with his father, who is called "William the Bad." William II was celebrated in Dante's *Paradiso* (Canto 20) and Boccaccio's *Decameron* (4.4 and 5.7).

William II was a strong ruler who did little to diminish the model of monarchy established by his predecessors, especially his grandfather, Roger II. William II's reign was notable for his foreign policy. He married Joan, the daughter of King Henry II of England, in 1177. Also in 1177, he negotiated a truce with Frederick I Barbarossa, who had recently been defeated by the Lombard League at Legnano (1176). William II's most enduring accomplishment was contracting a marriage in 1186 between Frederick I Barbarossa's son Henry (later Emperor Henry VI Hohenstaufen) and William's aunt and heir, Constance (daughter of Roger II). This marriage not only gave the Hohenstaufen an undeniable connection to the southern Italian realm but also produced one of the most important medieval rulers: Frederick II.

William II also undertook several military campaigns against the Byzantines and the Muslim North Africans. He launched a massive attack on the Byzantines in 1185 and captured Thessalonica, but his forces were defeated and dispersed before they reached Constantinople.

Another impressive accomplishment of William II was his founding of the extraordinary Benedictine monastery at Monreale in Sicily in 1174. The decoration and architecture of the cathedral at Monreale are regarded as a monument to the multicultural influences that characterized the kingdom of southern Italy and Sicily: Norman, Byzantine, Arab, and Italian.

William III (late twelfth century) was crowned king of Sicily either shortly after the death of his brother Roger III in late December 1193, while their father King Tancred (Tancred of Lecce) was yet alive, or else after Tancred's death in February 1194; in this matter, as in others, the sources for his poorly documented reign are neither unanimous nor altogether trustworthy. The earliest of William's few known charters is dated June 1194. As he was only a child when he became king, a regency was exercised for him by the queen mother, Sibylla of Acerra. Her government, largely a continuation of Tancred's, prepared for and then resisted the invasion of Henry VI until November 1194, when Henry had conquered most of the kingdom and was now outside the walls of Palermo. In the ensuing negotiations for a surrender, Sibylla obtained Henry's promise to grant William (or perhaps herself; again, the sources differ) the county of Lecce and to make him prince of Taranto, undertakings Henry seems to have honored. Henry's triumphal entry into the city on 20 November marks the official beginning of his reign; by then William's was already over.

In late December, Henry had William, Sibylla, and others politically close to them arrested and publicly condemned for treason. Their conspiracy against Henry has been widely considered a fabrication; its outcome was certainly convenient for him. The now proclaimed traitors were soon (early 1195) sent to confinement in Germany, along with various other captives (including William's three sisters and his sister-in-law, the princess Irene). William seems to have been separated from the rest en route and is said to have been kept in Hohenems castle in present-day Austria. He is also reported to have been blinded and, according to one chronicle (which is not always reliable), deprived of his penis; both mutilations are possible and would have served different though related ends. Pope Innocent III appealed for his release early in 1198, but William was not among the prisoners who were let go that year, and the presumption is that he was already dead.

William Durandus

William Durandus (Guillelmus Duranti, Guillaume Durand; c. 1230 or 1231-1 November 1296) is called the Elder to distinguish him from a nephew with the same name. The elder William Durandus was born in Puimisson, near Béziers in Provence. We know practically nothing about his family or early life before his ordination as subdeacon in the cathedral of Narbonne c. 1254 and his enrollment in the list of canons at the cathedral of Maguelonne at about the same time. Not long after taking clerical orders, William began formal legal studies at the University of Bologna; he earned a doctorate in canon law there c. 1263. He may have lectured at the university before he became a papal chaplain and "general auditor" under Pope Urban IV (r. 1261-1264). Early in his long and increasingly difficult career in the service of the

papal curia, William befriended the best-known canonist in Europe, Cardinal Henricus de Segusia (Henry of Susa), known as Hostiensis.

Under Pope Clement IV (1265–1268), William continued his service as papal chaplain and auditor. He also finished the first edition of his first publication, *Aureum repertorium* (c. 1264–1270), a short index and commentary on Gratian's *Decretum* (c. 1140) and on Pope Gregory IX's *Liber extra* (1234). *Aureum repertorium* was soon followed by William's massive and—during the medieval period—definitive textbook on procedural law, *Speculum Iudiciale* (c. 1271 — 1276). The enduring fame of this work earned William the nickname Speculator, by which he was commonly known during and after his lifetime.

In the summer of 1274, William attended the Second Council of Lyon and held the official title of *peritus* (theologian) for Pope Gregory X (1271-1276). William later assisted in the post-conciliar editing of the canons of the council, and some twenty years afterward he published the final version of *In sacrosanctum Lugdunense concilium commentarius* (c. 1293-1294), his long commentary on the council's decrees.

By 1279, William was ordained a priest and was made dean of the cathedral of Chartres by Pope Nicholas III (r. 1277-1280). In 1280, Nicholas appointed him *rector et capitaneus generalis* of a portion of the papal states (including a part of Tuscany and the diocese of Rieti). In 1281, the new pope, Martin IV (r. 1281-1285), added to William's official duties rule of the turbulent Romagna. From 1282 to 1286, William coordinated the war efforts of the papacy in the Romagna, leading the pro-papal Guelfs to a precarious interim victory over the Ghibellines.

In 1285, William submitted his resignation from the papal service to Pope Honorius IV (r. 1285-1287). Within a month, William was elected bishop of Mende in his native Provence by the cathedral chapter. He was consecrated bishop by the archbishop of Ravenna in 1286 but (inexplicably) remained in Rome for another five years before taking up residence in Mende in July 1291.

William's prolific literary production during his episcopacy demonstrates his conscientious application of his learning to pastoral care (not to mention his capability as an encyclopedic polymath). The works he published in this period include the following: *Constitutiones*

synodales (c. 1292), a collection of statutes and instructions for the reform of the clergy of his diocese; *Ordinarium* (c. 1291-1293), a book regulating the liturgical services of the cathedral of Mende; his commentary on the Second Council of Lyon; *Rationale divinorum officiorum* (c. 1291-1296), a long allegorical commentary on the entire liturgy (including the mass, divine office, and church year); and *Pontificate* (*Bishop's Book*, c. 1293–1295), which provided rubrics and prayers for liturgical services performed only by a bishop. Modern scholarship has revealed that William's *Rationale* and *Pontificale* were two of the most important liturgical texts of the entire medieval period in Europe.

William had been a resident bishop for only four years when he succumbed to the persistent entreaties of his friend Benedict Gaetani, now Pope Boniface VIII (r. 1294-1303), to return to Rome and assume official duties in the papal states. In September 1295, William was appointed rector of the Anconian March and the Romagna, territories that were in a state of near-anarchy since the Ghibelline faction had mobilized itself for war with the Guelfs. William's command of the papacy's war effort failed, however, when he lost the city of Imola to the Ghibellines and presided over the defeat of a pro-papal Bolognese army in April 1296. By the end of the summer of 1296, William, who was by then in his sixties, seems to have had little if any official responsibility in the papal states. He continued to reside in Rome, where he died.

William Durandus the Elder was buried in the church of Santa Maria Sopra Minerva. A thirty-line epitaph praising his life and works was inscribed there in marble, possibly at the request of his nephew William Durandus the Younger, who succeeded him as bishop of Mende.

William Durandus. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 216v.

There are numerous incunabula and early printed editions of *Aureum repertorium super toto corpore iuris canonici*, but as of the present writing there was no modern edition. *Speculum iudiciale* survives in more than 100 medieval manuscripts; there are numerous incunabula and early printed editions but (again as of this writing) no modern edition. A manuscript (possibly written or corrected by Durandus himself) of *Constitutiones synodales* was published in a diplomatic edition (Berthelé and Valmary 1905). The only known printed edition of *In sacrosanctum Lugdunense concilium commentarius* is that of 1569. The *Pontificate* was published in the magisterial edition of Andrieu (1940). The *Rationale divinorum officiorum* survives in hundreds of medieval Latin manuscripts, as well as numerous medieval vernacular translations; the first modern critical edition is Davril and

Thibodeau (1995, 1998). Although a complete modern biography of Durandus has yet to be written, the bibliography of secondary sources is voluminous; selected references are listed below.

Witigis

Witigis (d. 542) was an Ostrogoth king of Italy. He was declared king by the nobility in opposition to the ineffectual Theodahad in 536 and immediately ordered Theodahad's death. Amid a circle of raised swords, Witigis was held aloft on a shield and hailed king—a ceremony that may have been Germanic in origin but had by then become essentially a Roman military tradition. He was also formally announced to the Goths by Cassiodorus in the language used to proclaim Roman emperors. Thereafter, Witigis's life was focused on warfare, but he did not abandon the other aspects of Ostrogothic government. He attempted to continue routine government in the areas under his control, and he minted coins in keeping with the issues of Theodoric. He promptly married Matasuentha, who was Athalaric's sister and Theodoric's sole surviving direct heir; the wedding was celebrated with a traditional Roman *laudes* given by Cassiodorus.

Initially, Witigis was fairly successful against the forces of Justinian I, but ultimately he had to withdraw all the Ostrogothic contingents from the borderlands to fight in Italy. The war soon centered on Rome, where Witigis and his forces were besieged. After many months, Witigis fled to Ravenna, where he and his wife were captured. However, Witigis went on to fight for Rome in the east until his death. His widow married Germanus, a nephew of Justinian.

Wool Industry in Italy

The rise of an export-oriented woolen industry in twelfth-century Italy can first be traced in the prosperous cities of the Po valley. The region was linked to the ports of Genoa and Venice by an efficient and low-cost system of river transport. It was also the southern terminus of the overland connections to the fairs of Champagne, which were a major conduit for the trade in fine Flemish cloth. The progression from rural coarse cloth production on monastic estates to an urban industry based on imitations of some grades of Flemish fabrics was a natural outcome of the growth of the ancillary crafts of dyeing and refinishing of Flemish cloth for reexport, which came to be concentrated in the Italian towns.

In the early stages of industrial development, urban producers drew on superior grades of domestic wool and imported merino wool from North Africa in order to create a line of uniform products which offered a low-cost alternative to Flemish woolens in Mediterranean markets. The spread of the new techniques from the towns of Lombardy and the Veneto (most notably Verona) to other cities in Tuscany and central Italy was effected through the organized migrations of textile workers under the sponsorship of host communes and local merchant entrepreneurs who offered numerous privileges and inducements to those willing to relocate.

The first decades of the fourteenth century witnessed a shift in marketing strategy as leading urban producers reduced their output of the middling and lower varieties of cloth in order to concentrate on higher-profit lines fabricated from imported English wools. This paralleled a similar shift in Flanders, which was a response to heightened competition from the spread of cloth manufacturing in various regions of Europe. It was also an attempt to meet a growing

demand for fashionable luxuries among urban elites, a trend decried by contemporary moralist writers. As noted by the chronicler Giovanni Villani, the rapid rise of the Florentine woolen industry from relative obscurity to a position of prominence in the thirteenth century was due to the adoption of higher-margin luxury fabrics produced in limited quantities.

An exclusive reliance on English wool was undermined in the 1340s, when higher tariffs and reduced supplies forced a turn toward alternative sources of raw materials. Only a limited output of the finest luxury cloth based on English wool was maintained. Instead, prime grades of Spanish, Provencal, and Majorcan wools, improved through crossbreeding and systematic transhumance, were used in a second line of products, the launching of which entailed a substantial realignment of technical prescriptions. These included the application of cost-saving technologies such as the use of the spinning wheel for both warp and weft threads and the adoption of the fulling mill in place of labor-intensive fulling by foot. Experiments with dyestuffs and finishing techniques enhanced the surface characteristics of the fabric. Florence took the lead in the introduction of a fine, lightweight fabric woven from prime Mediterranean wools. Florentine *garbo* cloth, produced in a narrow range of qualities and prices, competed favorably with traditional Flemish and Brabantine fabrics in western Europe. It soon came to constitute the largest single category of Florentine woolen production and the standard that other industrial centers in Italy sought to reach.

Beginning in the 1350s, Florentine woolen artisans were actively recruited by other cities seeking to upgrade their industrial standards—an effort that accelerated after the *ciompi* revolt of 1378, in which woolen workers played a major role. Not all these attempts were successful. After 1400, a visible hierarchy based on specialization and product differentiation developed among textile centers. Leading cloth producers such as Florence, Verona, Bergamo, and Venice opened new markets for their brand-name fabrics among affluent urban consumers in the Ottoman empire and eastern Europe, where Italian woollens challenged and ultimately displaced Flemish luxury cloth. Spanish and other imported and domestic wools were used by towns and expanding industrial villages in Lombardy and the Veneto in the production of

medium grades of cloth that also found outlets in Venetian trade. The position of Italian woolens in these external markets was not challenged until the end of the sixteenth century, when lower-priced English broadcloths and fine Dutch woolens made inroads into transcontinental and Mediterranean commerce.

The woolen industry was the most important industrial sector in medieval Italy in scale of production, level of capitalization, and size of the labor force, and it was a principal source of private and public wealth. Employers' guilds—a prime example of early capitalistic structures—coordinated the labor of thousands of wage earners, most of whom did piecework in their own homes. These guilds also controlled the dyers and finishers who managed their own workshops and employed apprentices and journeymen. An intense subdivision of labor developed, with specialized artisans in charge of each stage of production. Urban woolen guilds also claimed jurisdiction over rural weavers and spinners outside the city walls. Merchant entrepreneurs owned the tools, raw materials, and finished products and made all the decisions regarding investment and production. Loans extended to workers during slack seasons increased their dependence on employers. Infractions and debts of workers were adjudicated in the guild court, where fines and penalties were assessed.

In the 1370s, during a period of civil unrest and economic dislocation, tension within the industry led to citywide workers' revolts in Siena, Perugia, and Florence. Marxist historians have cited these revolts as evidence of an emerging proletarian consciousness; however, the demands of disenfranchised workers for recognition in guilds suggests a political strategy that was closely attuned to the prevalent ethos of urban corporate government. Still, over the long run violent uprisings among the laboring classes contributed to a weakening of communal institutions.

Z

Zacharias, Pope

Pope Zacharias (Zachary, saint; d. 752, r. 741–752), a Calabrian of Greek ancestry, was a refined scholar and had been an active adviser to his predecessor, Pope Gregory III.

Whereas Gregory had been hostile to the powerful Lombard king Liutprand, Zacharias abandoned that policy and negotiated a firm peace, sealed by a personal interview in the Lombard camp (742). When Liutprand turned his aggression instead against Ravenna, Zacharias mediated a truce (743). After Liutprand died (744), his successor, Ratchis, renewed his treaty with the pope but revived the Lombards' offensive against Ravenna. Zacharias was able to persuade Ratchis to withdraw (in 749), but Ratchis was then replaced (also in 749) by his brother Aistulf, who finally achieved the Lombards' long-standing goal of annexing Ravenna and ending the Byzantine exarchate in northern Italy (751). This triumph emboldened Aistulf to menace Rome.

In the face of the recurrent Lombard threat, Zacharias turned once more to his nominal master, the Byzantine emperor Constantine V (r. 741–775). Constantine was the son and successor of Leo III and was a fanatical proponent of Leo's Iconoclastic policies, which westerners resisted and which the popes continued to condemn. Initially, Constantine's position on the throne was precarious, and this situation impelled him at that point to join in a conciliatory understanding. However, he could not provide the pope with any substantial aid from the east, and there is evidence that Constantine himself may have encouraged the pope to seek help elsewhere.

In any case, Zacharias was caught up in the momentum of active dealings with German regions to the north and, above all, with the powerful Frankish monarchy—dealings that had been established by his two predecessors. Through Saint Boniface, the pope was already involved with programs of reform in the Frankish church; these

programs were likewise supported by the successor of Charles Martel as Frankish mayor of the palace, Pepin the Short. Pepin was at this time seeking to take the full title of king in place of the feeble Merovingian figurehead. In 750, Zacharias effectively authorized Pepin's initiatives and aims. When Pepin formally deposed the Merovingian dynast in November 751 and received an annointment from Saint Boniface, he clearly owed a debt to the papacy; eventually, he would repay it by supporting the beleaguered popes.

Zacharias died the following year, and his successor, Stephen II, would be the beneficiary of Pepin's support. Nevertheless, it was obviously Zacharias who had played the pivotal role in creating the alliance between the papacy and the Franks that would alter the course of subsequent European history.

Zanobi Da Strada

The poet Zanobi da Strada (1312-1361) was born in Florence and enjoyed the lifelong patronage of the Florentine Niccola Acciaiuoli. At an early age, Zanobi became friends with Giovanni Boccaccio, Petrarch (Francesco Petrarca), and Francesco Nelli—the men in whose correspondence we find most of our information regarding Zanobi's biography. Of the three friendships, that with Petrarch was doubtless the strongest.

In 1352, following Petrarch's advice, Zanobi moved to Naples, where he joined the Angevin court. Three years later, in Pisa, Zanobi was crowned poet laureate by Emperor Charles IV, who was probably motivated in part by a desire to do Acciaiuoli a political favor. Several of Zanobi's contemporaries, including Petrarch and Boccaccio, felt that the award was unmerited because Zanobi preferred prose to poetry and preferred the vernacular to Latin. Despite the souring of his reputation as a poet after his controversial coronation, Zanobi is still remembered as a respected grammarian, scholar, and teacher; as a collector of manuscripts; and as papal secretary to Innocent VI. Among Zanobi's relatively few extant compositions are a handful of brief Latin poems, some personal letters, and translations of Gregory the Great's *Moralia on Job* and Macrobius's *Dream of Scipio*.

Although we do not know whether Zanobi received holy orders, it is certain that he lived for a time at the monastery of iMonte Cassino.

Zeno, Emperor

Zeno (Tarasicodissa, Tarasikodissa; d. 491, r. 474-491) was born a chieftain of the rugged Isaurian mountaineers of south-central Asia Minor and was among those used for military service in Constantinople. He took his Greek name, Zeno, c. 466, when he became the factional ally and son -in-law of the eastern Roman emperor Leo I (r. 457–474), whom he succeeded.

Zeno was regarded as an alien by the populace, was hated and vilified by his contemporaries, and faced unrest and insurrection throughout his reign. For a brief while (475-476), he was dispossessed of the throne by a rival, Basiliscus. Among the factors in the unrest was the festering Monophysite controversy, which Zeno attempted to neutralize with his arbitrary doctrinal decree, the *Henoticon* (482). This intervention failed to mollify the Monophysites, and it also provoked the first breach between the bishops of Rome and Constantinople, known as the Acacian schism (484-518).

In 476, the barbarian commander Odovacar ended the imperial succession in the west (this event is often miscalled the fall of the Roman empire). Zeno then had to recognize Odovacar's usurpation of the rule of Italy and claim to the title of patrician. Apparently, however, it was Zeno's idea to authorize Theodoric, king of the Ostrogoths, to

invade Italy (489), displace Odovacar (493), and create the Ostrogothic kingdom there, a process that also removed the Ostrogoths as a menace in the Balkans.

Zita, Saint

Saint Zita (c. 1208–1278) was born at Pontremoli and spent her life, from the age of twelve on, as a servant in the household of the noble Faitinelli family of Lucca. Her self-sacrifice and devotion, in material conditions that were unusually harsh even by the standards of the time, earned her widespread fame (and, eventually, better treatment from the family). Popular devotion to Zita increased after her death, and a local cult was licensed by the bishop of Lucca in 1282, after numerous reports of miracles at her tomb in the church of San Frediano. By the early 1300s, her renown had grown to the point where Dante used her name as an ironic periphrasis for the city of Lucca itself (*Inferno*, 21.38). However, she was not canonized until 1696.

Athaiaric (536—534)

Theodahad (534-536)

Witigis (536-540)

Lombard Kings

Alboin (567-572)

Cleph (572-574)

Authari (584-590)

Agilulf (590-616)

Adaloald (616-626)

Arioald (626-636)

Rothari (636-652)

Rodoald (652-653)

Aripert I (653-661)

Godipert (661-662)

Grimoald (662-671)

Garibald (671)

Pertari (671-688)

Cunipert (688-700)

Liutpert (700-701)

Raginpert (701)

Aripert II (701-712)

Liudprand (712-744)

Aistulf (749-756)

Desiderius (756-774)

Carolingian Dynasty

Pepin, king of the Franks (751-768)
Carloman (768-771)
Charlemagne, king of the Franks (768-814), emperor (800-814)
Louis I, the Pious, emperor (814-840)
Lothair, emperor (840-855)
Louis II, emperor (855-875)
Charles the Bald (843-877), emperor (875-877)

Holy Roman Emperors

Carolingian Dynasty:

Charlemagne (800-814)
Louis I (814-840)
Lothair I (843-855)
Louis II (855-875)
Charles II (875-877)
Charles III (881-887)

House of Spoleto:

Guy (Guido di Spoleto, 891-894)
Lambert (Lamberto di Spoleto, 894-898)

Carolingian Dynasty:

Arnulf of Carinthia (896-899)
Louis III (901-905)

House of Franconia:

Conrad I (911-918)

Carolingian Dynasty:

Berengar (Bergario I, 915-924)

House of Saxony:

Henry I (919-936)
Otto I (936-973)
Otto II (973-983)
Otto III (983-1002)
Henry II (1002-1124)

Salian Dynasty:

Conrad II (1024-1039)
Henry III (1039-1056)
Henry IV (1056-1106)

Rival Claimants:

Rudolf (Rudolf of Swabia, 1077-1080)
Hermann (1081—1093)
Conrad (1093-1101)
Henry V (1111-1125)

House of Supplinburg:

Lothar II (1125-1137)

House of Hohenstaufen:

Conrad III (1138-1152)
Frederick I, Barbarossa (1152-1190)
Henry VI (1190-1197)
Philip (1198-1208)

Welf Dynasty:

Otto IV (1198-1214)

House of Hohenstaufen:

Frederick II (1215-1250)

Rival Claimants:

Henry (VII, 1220-1235)
Henry Raspe (1246-1247)
